NORWEGIAN NATIONAL ADVISORY UNIT ON ARTHROPLASTY AND HIP FRACTURES 2015 ANNUAL REPORT

This annual report presents results and descriptive statistics from our five registers. The Paediatric Hip Register has recently received pre-national status and its finances are ensured through funding from Helse Vest.

National medical quality registers must have a general manager employed by the hospital where the register is located; in the case of our registers, this is Helse Bergen. Knut Fjeldsgaard is now the general manager of the Cruciate Ligament Register.

As required by the Interregional Steering Committee for the National Service Centre for Medical Quality Registers, the results at hospital level from the Hip Fracture Register were published in autumn 2014 (<http://www.kvalitetsregistre.no/resultater/>). In the present annual report, we publish for the first time, at hospital level, the ten-year survival rate of hip and knee replacements, the ten-year survival rate of ACL graft surgery and the two-year implant survival rate after hip fracture surgery. The results are presented with an explanation of the limitations of our data, together with results of coverage analyses showing the proportion of the operations notified to the Norwegian Patient Register (NPR) which were also reported to our registers, and vice versa.

The completeness analyses were performed in collaboration with the National Service Centre for Medical Quality Registers of the Centre for Clinical Documentation and Evaluation (SKDE) and the NPR. The results of the completeness analyses for total hip and knee arthroplasties, as well as for operations for hip fractures and knee ligament injuries, were also published in last year's report.

All orthopaedic surgeons should help to check the completeness in their own hospital. In hospitals with poor completeness, the surgeons should review their procedures for collection and submission of forms to the registers, and their present coding practice on operations on the relevant joints in the administrative system of the hospital (to the NPR). In our reports, we provide advice on the use of codes. The Directorate of Health and the Centre for Clinical Documentation and Evaluation (SKDE) have made separate reports based on the completeness analyses from our registers. These reports are available at <http://www.kvalitetsregistre.no> and www.helsedirektoratet.no. We are now working on completeness analyses for prostheses in other joints than the hip and knee and for the Paediatric Hip Register. We plan to repeat the analyses every second year.

Norwegian orthopaedic surgeons have long been requesting a system of electronic reporting to the registers. The National Service Environment for Medical Quality Registers is dealing with this, but it has proved difficult to develop a system that is legal and as easy for surgeons to use as the paper forms, and which enables reporting of implant data at a catalogue number level. There is also ongoing work on a system of electronic recording and transmission of patient-reported outcome measures (PROM) for the joint replacement registers and the Cruciate Ligament Register. The systems should be compatible with the various electronic recordkeeping and administrative systems used in hospitals, and should comply with Norwegian regulations for electronic transmission of personally identifiable health information. It remains uncertain when these tools will be ready for use.

The annual report is sent electronically to all Norwegian orthopaedic surgeons. Paper copies can be obtained by contacting us. The Norwegian Arthroplasty Register website <http://nrlweb.ihelse.net/> contains all our annual reports and references to all our scientific papers and presentations. Most of the papers are also available electronically from our website.

We mainly publish our findings on implants and surgical methods in scientific journals, where we can explain materials and methods and discuss strengths and weaknesses and the significance of the findings. We refer to the reference list at the end of the present report.

Hospital-based annual reports, with data from each hospital, will as before be sent to our contact persons at the hospitals. We encourage our contacts to check the coverage analysis and that the figures recorded from the hospital are correct, and to use the reports for local quality control work.

Please remember that the Norwegian Data Protection Authority requires consent forms to be signed by patients before operations are reported to the registers, and the declarations of consent must be stored in the patient record in the hospital.

We would like to thank all orthopaedic surgeons in Norway for good reporting. We are also grateful for good cooperation with Helse Bergen, Helse Vest, SKDE, the equipment suppliers, the University of Bergen, NPR, the Norwegian Knowledge Centre for the Health Services, the Norwegian Institute of Public Health, the Office of the Auditor General, the Norwegian Board of Health Supervision, the Directorate of Health and the Ministry of Health and Care Services.

THE HIP ARTHROPLASTY REGISTER 2015 ANNUAL REPORT

This year's annual report contains data from 190 962 total hip replacement operations. In 2014, there were 8099 primary operations and 1284 revisions. The figures are similar to those from 2013.

TRENDS AND RISK OF REVISION

Overall, there has been a positive development with improved results over time, but the risk of early reoperation has increased in recent years, when there have also been changes in surgeons' choice of prostheses and operation techniques.

In recent years, uncemented prostheses have been more frequently used for elderly patients than previously. This change in practice is not supported by the literature (Dale et al. 2012; Mäkelä et al. 2014; Jämsen et al. 2014), and we see in this year's report that the increased use of uncemented femoral prostheses in elderly patients has now ended.

In Table 26 and Figure 13 in this year's report, we now see a clear reduction in the use of 22 and 28 mm head diameters, and increased use of 32 mm. This is probably beneficial, since 32 mm heads give a lower risk of dislocation. For articulation with highly crosslinked polyethylene there is no evidence that 32 mm leads to increased wear. Larger heads than 32 mm would probably further reduce the dislocation risk, but heads of 36 mm or larger could increase the risk of fretting (corrosion) on the taper joint between head and neck.

There have also been changes in the choice of surgical approach. The use of minimally invasive anterior and anterolateral approaches has been increasing for several years, but this has now levelled off. The use of posterior approaches has increased over the last seven years and is still on the increase, at the expense of the direct lateral approach. This may be beneficial, since Amlie et al. (2014) showed that with a direct lateral approach about 25% of patients experienced limping after surgery. This was about twice as many as for patients who underwent other surgical approaches.

We are not certain as to whether limping after a direct lateral approach has always been a problem or whether this is due to changes in surgical technique or earlier postoperative weight bearing than before. To gain a better overview of the problem, we ask all surgeons to report to the Hip Register all reoperations involving muscle transposition or re-fixation of the gluteus medius

Although early revisions have increased somewhat, hip replacement surgery shows good results.

METAL ON METAL (MoM) PROSTHESIS

Please remember that hospitals have a duty to regularly monitor all patients with MoM prostheses with a diameter of >32 mm for the rest of their lives, as recommended by the Norwegian National Advisory Unit on Arthroplasty and Hip Fractures (<http://nrlweb.ihelse.net/> or <http://www.haukeland.no/nrl/>) and in line with similar recommendations in other countries.

PUBLICATIONS:

From 1 January 2014 to date, the Register has published 17 papers dealing with total hip arthroplasty. See the publication list later in the annual report and on the website of the Register (<http://www.haukeland.no/nrl/> or <http://nrlweb.ihelse.net/>).

SUMMARY OF SIGNIFICANT SCIENTIFIC FINDINGS LAST YEAR

Mäkelä et al. (BMJ) found in the NARA database that in patients over 65 years the results of cemented hip prostheses were better than those of uncemented hip prostheses.

Pedersen et al. (Osteoarthritis Cartilage), in a study of NARA data on patients under 55 years, found no overall difference between cemented and uncemented prostheses. Young patients with uncemented prostheses had fewer revisions due to loosening, and more early revisions due to dislocation, fracture and infection, than young patients with cemented prostheses.

Amlie E et al. (Acta Orthop) found that with a direct lateral surgical approach about twice as many (roughly 25%) of patients reported limping after hip replacement surgery, compared to those who had been operated on with a posterior or one of the anterior approaches.

Dybvik E. et al. (Acta Orthop) found that radiotherapy of patients with gynaecological cancer did not increase the risk of hip arthroplasty surgery.

Thien TM et al. (J Bone Joint Surg Am), using NARA data, found a greater risk of periprosthetic fracture with uncemented than with cemented prosthesis. With a cemented prosthesis, the risk was greater with a short prosthesis with a smooth surface than with a longer prosthesis with a non-smooth surface.

Stea S et al. (J Bone Joint Surg Am), in a study of the ICOR database (data from 6 registers), concluded that the use of uncemented hip prostheses in patients older than 75 years should be avoided.

Furnes O et al. (J Bone Joint Surg Am), in another ICOR study, found that total prostheses with metal-on-metal articulation with large heads (>36 mm) had a greater risk of revision after two years than prostheses with metal-on-cross-linked polyethylene articulation. ASR prostheses were not included in this study.

Allepuz A et al. (J Bone Joint Surg Am), also using ICOR data, found no benefits in using heads with a diameter greater than 32 mm, compared with heads of 32 mm diameter.

Paxton E et al. (J Bone Joint Surg Am), in an ICOR study with five-year follow-up, found no difference in results between prostheses with cross-linked and conventional polyethylene.

Lutro O et al. (Adv Orthop) examined bacteria from operations for infected hip arthroplasty from three five-year periods and found that the incidence of methicillin-resistant coagulase-negative staphylococci increased from 54% in the first period to 84% in the final period.

Hailer NP et al. (Acta Orthop) analysed data on 116 069 uncemented hip prostheses in NARA, and found that uncemented femoral prostheses without hydroxyapatite coating might have as good results as uncemented femoral prostheses with hydroxyapatite coating.

Varnum C et al. (Acta Orthop), using NARA data, found an increased risk of revision for uncemented femoral prostheses with metal-on-metal articulation compared with prostheses with other articulations. ASR prostheses had the highest risk of revision.

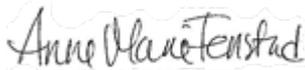

Schrama JC et al. (Acta Orthop), also studying NARA data, found that prosthetic patients with rheumatoid arthritis had a slightly greater risk of revision due to infection than prosthetic

patients with osteoarthritis.

Survival of total hip prostheses 1987-2014

Survival curves estimated by the Kaplan–Meier method. Risk ratio (RR) estimates adjusted for age, sex and diagnosis. Endpoint is all revisions. In the Hybrid and Reversed hybrid figures, the percentage of unrevised prostheses was given only for times where > 50 hips remained at risk.

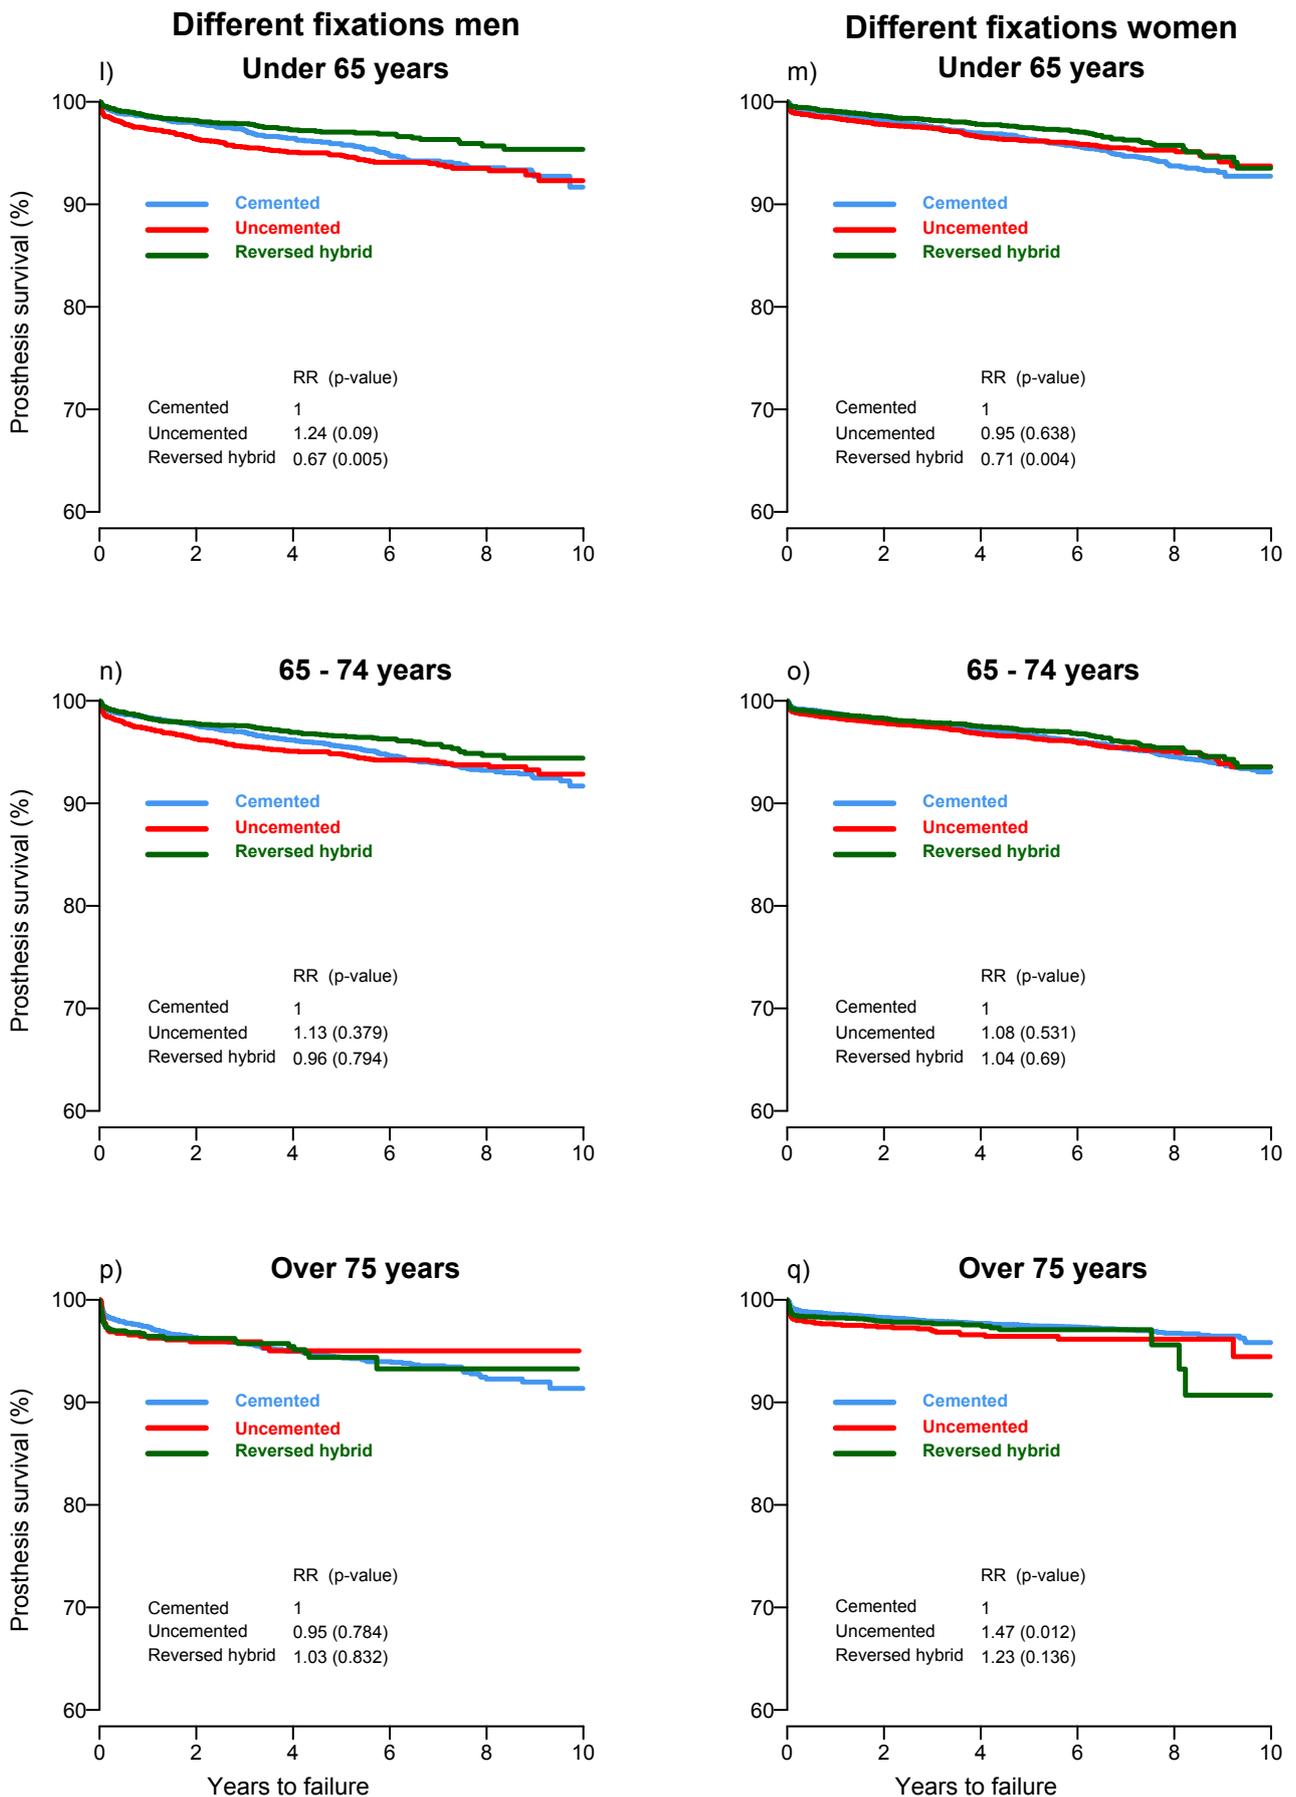

Survival of total hip prostheses 2005-2014

Survival curves estimated by the Kaplan-Meier method. Risk ratio (RR) estimates adjusted for age, sex and diagnosis.

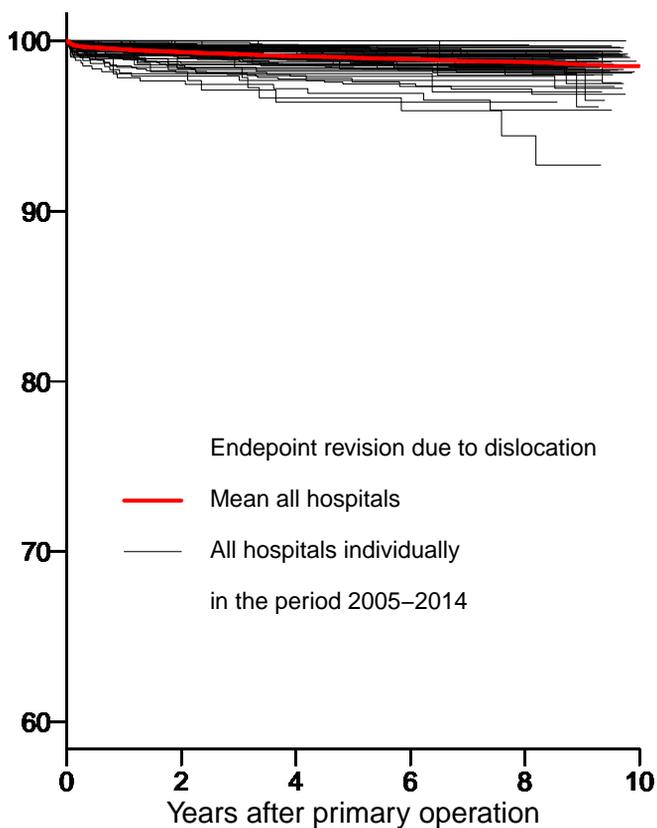

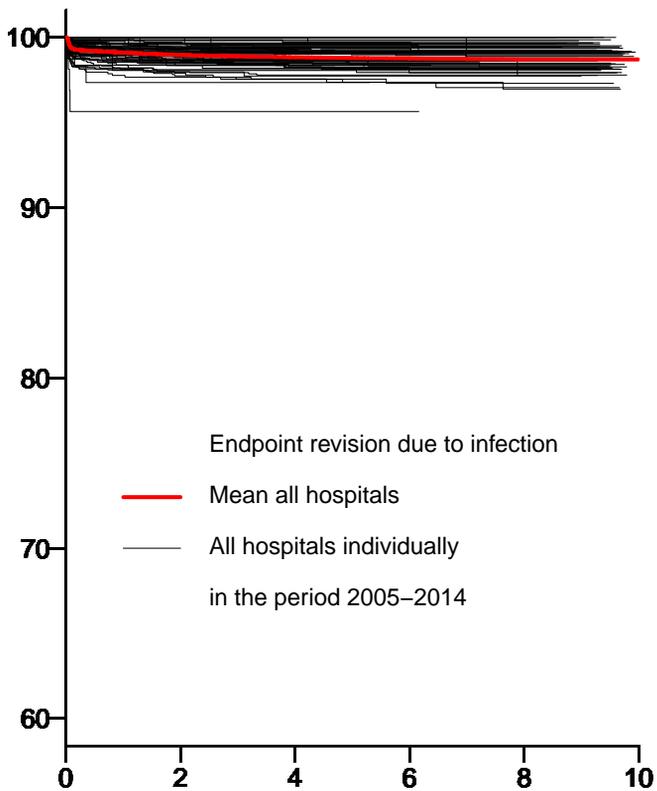

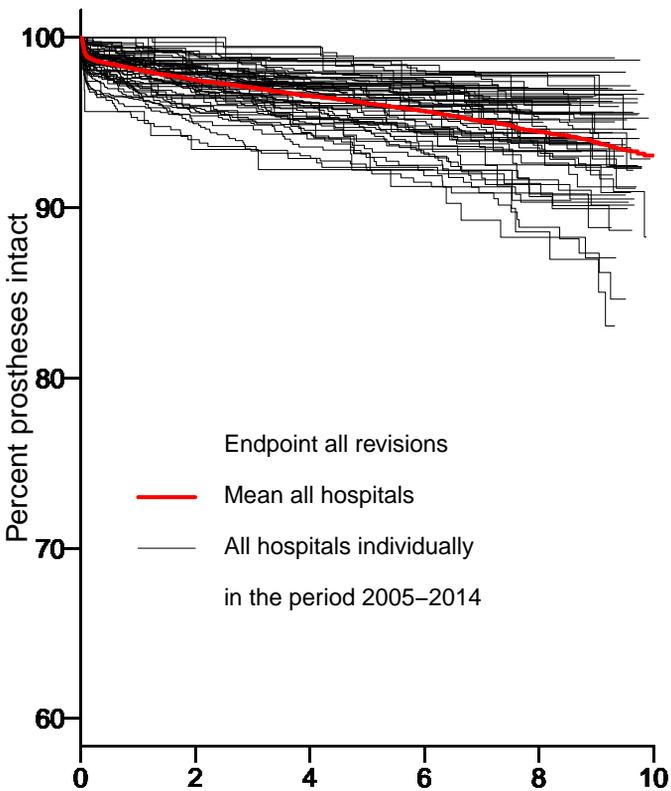

In the Hybrid and Reversed hybrid figure, the percentage of unrevised prostheses was given only for times where > 50 hips remained at risk.

Survival of total hip prostheses 2005-2014

Survival curves estimated by the Kaplan–Meier method. Risk ratio (RR) estimates adjusted for age, sex and diagnosis.

Total hip arthroplasty – Last 10 years survival curves for all hospitals individually

One stage bilateral hip prosthesis operations

Year	1987-2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	Sum:
Number of patients	136	13	12	15	13	19	15	15	18	26	23	22	327

A one stage bilateral operation is an operation where the patient is operated on both hips during the same operation or on the same day. Only primary operations are included.

Revision causes are not mutually exclusive. More than one reason of revision is possible

Figure 4a: Reasons for revisions for patients under age 65

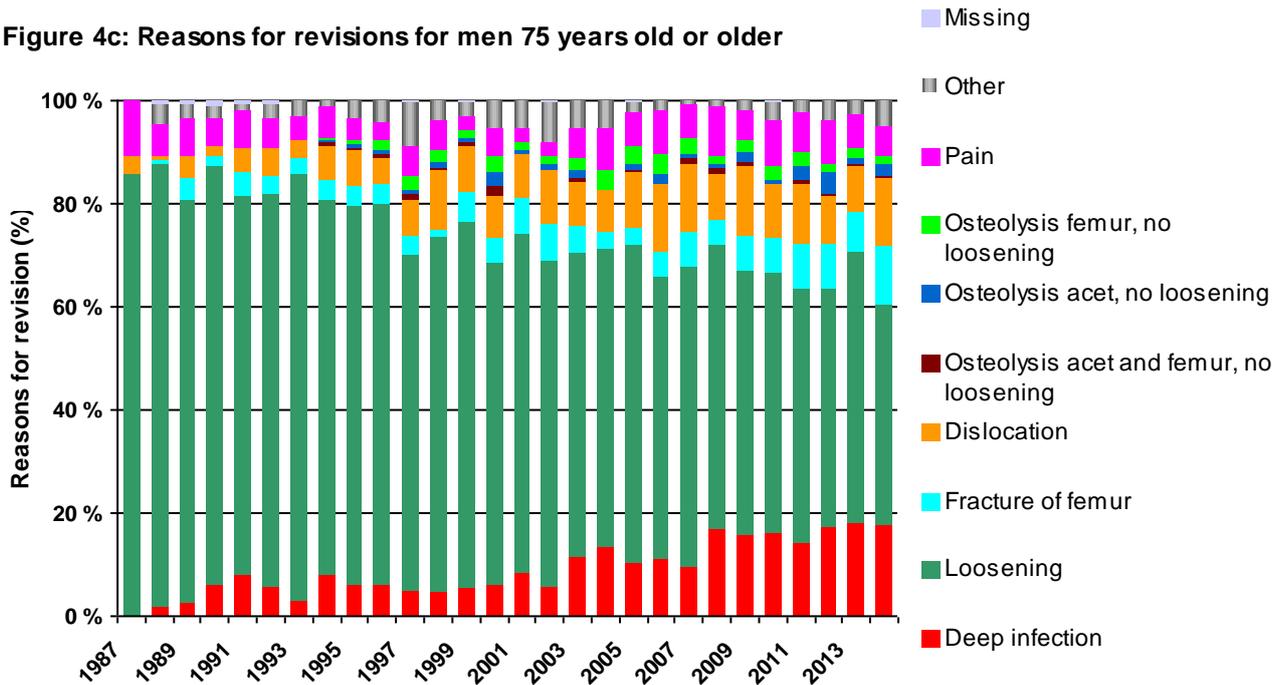

The graph is hierarchical, i.e. if a revision is marked both "Deep infection" and "Loosening", only "Deep infection" is counted. The hierarchy follows the explanation, with "Deep infection" being the highest and "Other" the lowest level.

Figure 4b: Reasons for revisions for patients between age 65 and 74

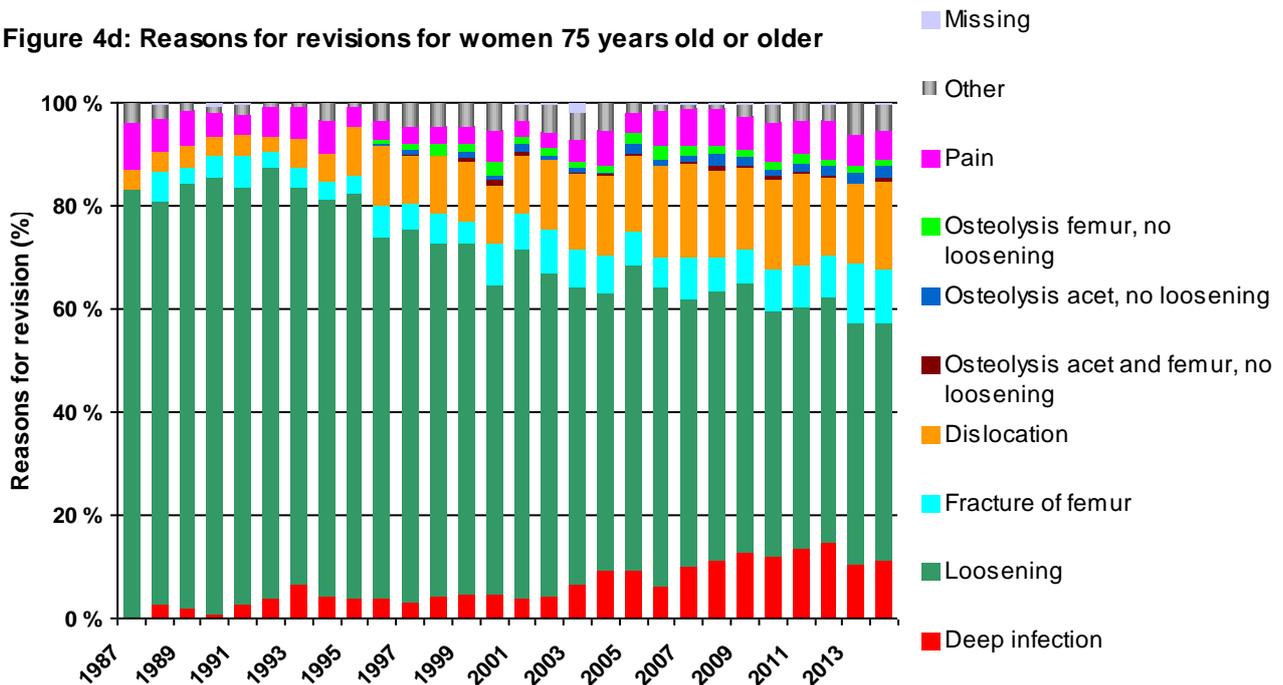

The graph is hierarchical, i.e. if a revision is marked both "Deep infection" and "Loosening", only "Deep infection" is counted. The hierarchy follows the explanation, with "Deep infection" being the highest and "Other" the lowest level.

Figure 4c: Reasons for revisions for men 75 years old or older

The graph is hierarchical, i.e. if a revision is marked both "Deep infection" and "Loosening", only "Deep infection" is counted. The hierarchy follows the explanation, with "Deep infection" being the highest and "Other" the lowest level.

Figure 4d: Reasons for revisions for women 75 years old or older

The graph is hierarchical, i.e. if a revision is marked both "Deep infection" and "Loosening", only "Deep infection" is counted. The hierarchy follows the explanation, with "Deep infection" being the highest and "Other" the lowest level.

Type of revision

Bone loss in revision - acetabulum (Paprosky Classification):

- Type I: Hemispheric acetabulum without edge defects. Intact posterior and anterior column. Defects in anchoring holes that do not destroy the subchondral bone plate.
- Type IIA: Hemispheric acetabulum without major edge defects, intact posterior and anterior column, but with small metaphyseal fractures again.
- Type IIB: Hemispheric acetabulum without major edge defects, intact posterior and anterior column, but with small metaphyseal fractures again and some lack of support superior.
- Type IIC: Hemispheric acetabulum without major edge defects, intact posterior and anterior column, but with defect in medial wall.
- Type IIIA: Significant component migration, osteolysis and bone loss. Bone loss from 10 o'clock until 2.
- Type IIIB: Significant component migration, osteolysis and bone loss. Bone loss from 9 o'clock until 5.

ASA classification

Figure 14: Primary operations

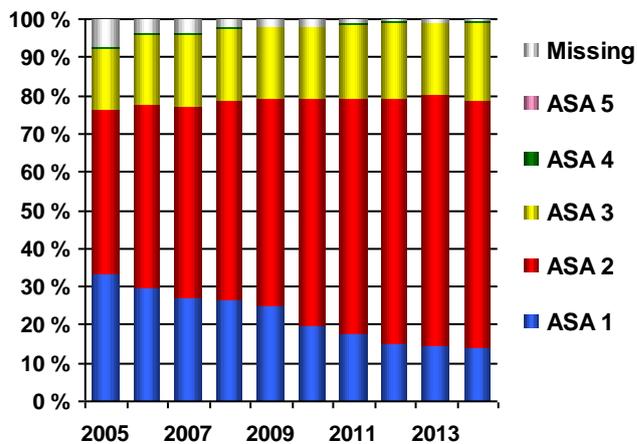

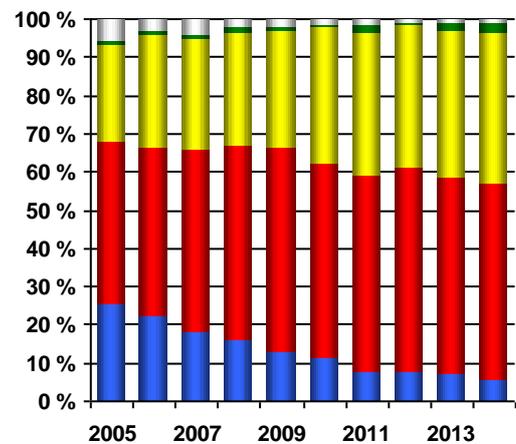

Figure 15: Revisions

ASA 1 = Healthy patients who smoke less than 5 cigarettes a day.

ASA 2 = Patients with an asymptomatic condition who are kept under medical control (f.ex. hypertension), or with diet (f. ex. diabetes mellitus type 2), and otherwise healthy patients who smoke five cigarettes or more daily.

ASA 3 = Patients having a condition that can cause symptoms. However, patients are kept under medical control (f. ex. moderate angina pectoris and mild asthma).

ASA 4 = Patients with a condition that is out of control (f. ex. heart failure and asthma).

ASA 5 = A moribund patient who is not expected to survive the operation.

Registration of ASA classification started in 2005

Completeness analysis for hip replacements in the Norwegian Arthroplasty Register, 2008-2011

A completeness analysis for the Norwegian Arthroplasty Register has been conducted by combining the data in the Register with data from the Norwegian Patient Register (NPR). The report and analysis were prepared by the NPR in collaboration with the Hip Arthroplasty Register (NAR). A report on the analysis and results will be published on www.helsedirektoratet.no. There are separate statistics on primary operations and revisions.

NCSF codes for combining data from NPR hospital stays and the Norwegian Arthroplasty Register

Type	Code	Description
Primary operation	NFB 20	Primary total prosthetic replacement of hip joint not using cement
	NFB 30	Primary total prosthetic replacement of hip joint using hybrid technique
	NFB 40	Primary total prosthetic replacement of hip joint using cement
	NFB 99	Other primary prosthetic replacement of hip joint
Reoperation	NFC 2*	Secondary implantation of total prosthesis in hip joint not using cement
	NFC 3*	Secondary implantation of total prosthesis in hip joint using hybrid technique
	NFC 4*	Secondary implantation of total prosthesis in hip joint using cement
	NFC 99	Other secondary prosthetic replacement in hip joint
	NFU 1*	Removal of total prosthesis from hip joint

* All codes beginning with this in the NCSF

The completeness for the Norwegian Arthroplasty Register was calculated as follows:

$$\frac{\text{(Only NAR + Inclusion in both registers)}}{\text{(Only NPR + Only NAR + Inclusion in both registers)}}$$

Completeness for the NPR was calculated in a similar way:

$$\frac{\text{(Only NPR + Inclusion in both registers)}}{\text{(Only NAR + Only NPR + Inclusion in both registers)}}$$

Primary operations. From 2008 to 2011, 29 656 primary hip replacements were reported to one or both of the registers. 96.5% of these were reported to the NAR while 97.2% were reported to the NPR. Completeness by hospital is presented in Tables 38 to 42, divided into health regions; these show a completeness for the Hip Arthroplasty Register ranging from 74.2% to 100% between the different hospitals. For hospitals with a low completeness for the Norwegian Arthroplasty Register, either the form was not sent to the NAR or other interventions than hip arthroplasties were incorrectly coded with NFB20/30/40/99 (There were only 53 operations in the category NFB99 during the period).

Procedure codes to be used for primary operations: NFB 20 - NFB 30 - NFB 40

Revision operations. From 2008 to 2011, 5529 revisions were reported to one or both of the registers. 88.1% of these were reported to the NAR while 83.8% were reported to the NPR. Completeness by hospital is presented in Tables 38 to 42, showing that the completeness for the Norwegian Arthroplasty Register varied between 16.7% and 100%. A low completeness may mean that the form was not sent to the NRL, or that other interventions than removal, replacement or insertion of a secondary prosthesis were incorrectly coded with NFC 2/3/4/99 or NFU1. The analysis shows that a number of revision forms are missing in cases where the prosthesis was removed without a new one being inserted in the same operation; in such cases, a form should be submitted both when the prosthesis is removed and when any new insertion is performed.

Procedure codes to be used for revision operations:

NFC2*- NFC3*- NFC4*- NFC99 - NFU1*

New: This completeness analysis is based on data from 2008 to 2011. From 2012, revisions due to infection, even where parts of the prosthesis are not removed or replaced, are to be reported on the form to the NRL. These must be coded **NFS 19, NFS 49 or NFW 69**.

HIP ARTHROPLASTY SURVIVAL RATES IN NORWEGIAN HOSPITALS

For the first time, we present ten-year survival rates for arthroplasties performed at hospitals in Norway. We have included prostheses from 2003-2014 from hospitals with more than 50 operations during this period. The Kaplan-Meier method with a 95% confidence interval was used. We provide the unadjusted rate for all types of total hip replacements. Results for hemi-prostheses are available in the report of the Hip Fracture Register. Only hospitals that performed operations in 2014 are included.

The results must be interpreted with caution, because differences in reoperation rates may be due to a number of factors:

1. Hospitals that are more rigorous in reporting their complications and reoperations to the Register could have unfairly negative results in the analysis.
2. If surgeons at one hospital are more diligent in facilitating check-ups for patients than at other hospitals, and thus discover more complications, this could lead to unfortunate results despite the fact that this hospital in reality is doing a better job than other hospitals.
3. If the waiting time for reoperations is longer in some hospitals than others, the longer wait could erroneously lead to better results than those of hospitals with a short waiting time.
4. If the surgeons at one hospital have a higher threshold for recommending reoperation than at other hospitals and thus prolong patients' problems, this will also give skewed results in the statistics.
5. Poor hospital results from an earlier period will remain with the hospital, even though the hospital may have acted upon previous problems by switching to better prostheses and improving procedures and surgical skills.

The completeness analysis shows the proportion of primary operations and revisions each hospital has reported to NPR. If the completeness of revisions is low in a hospital, it may indicate that the result found in our survival analysis is too high.

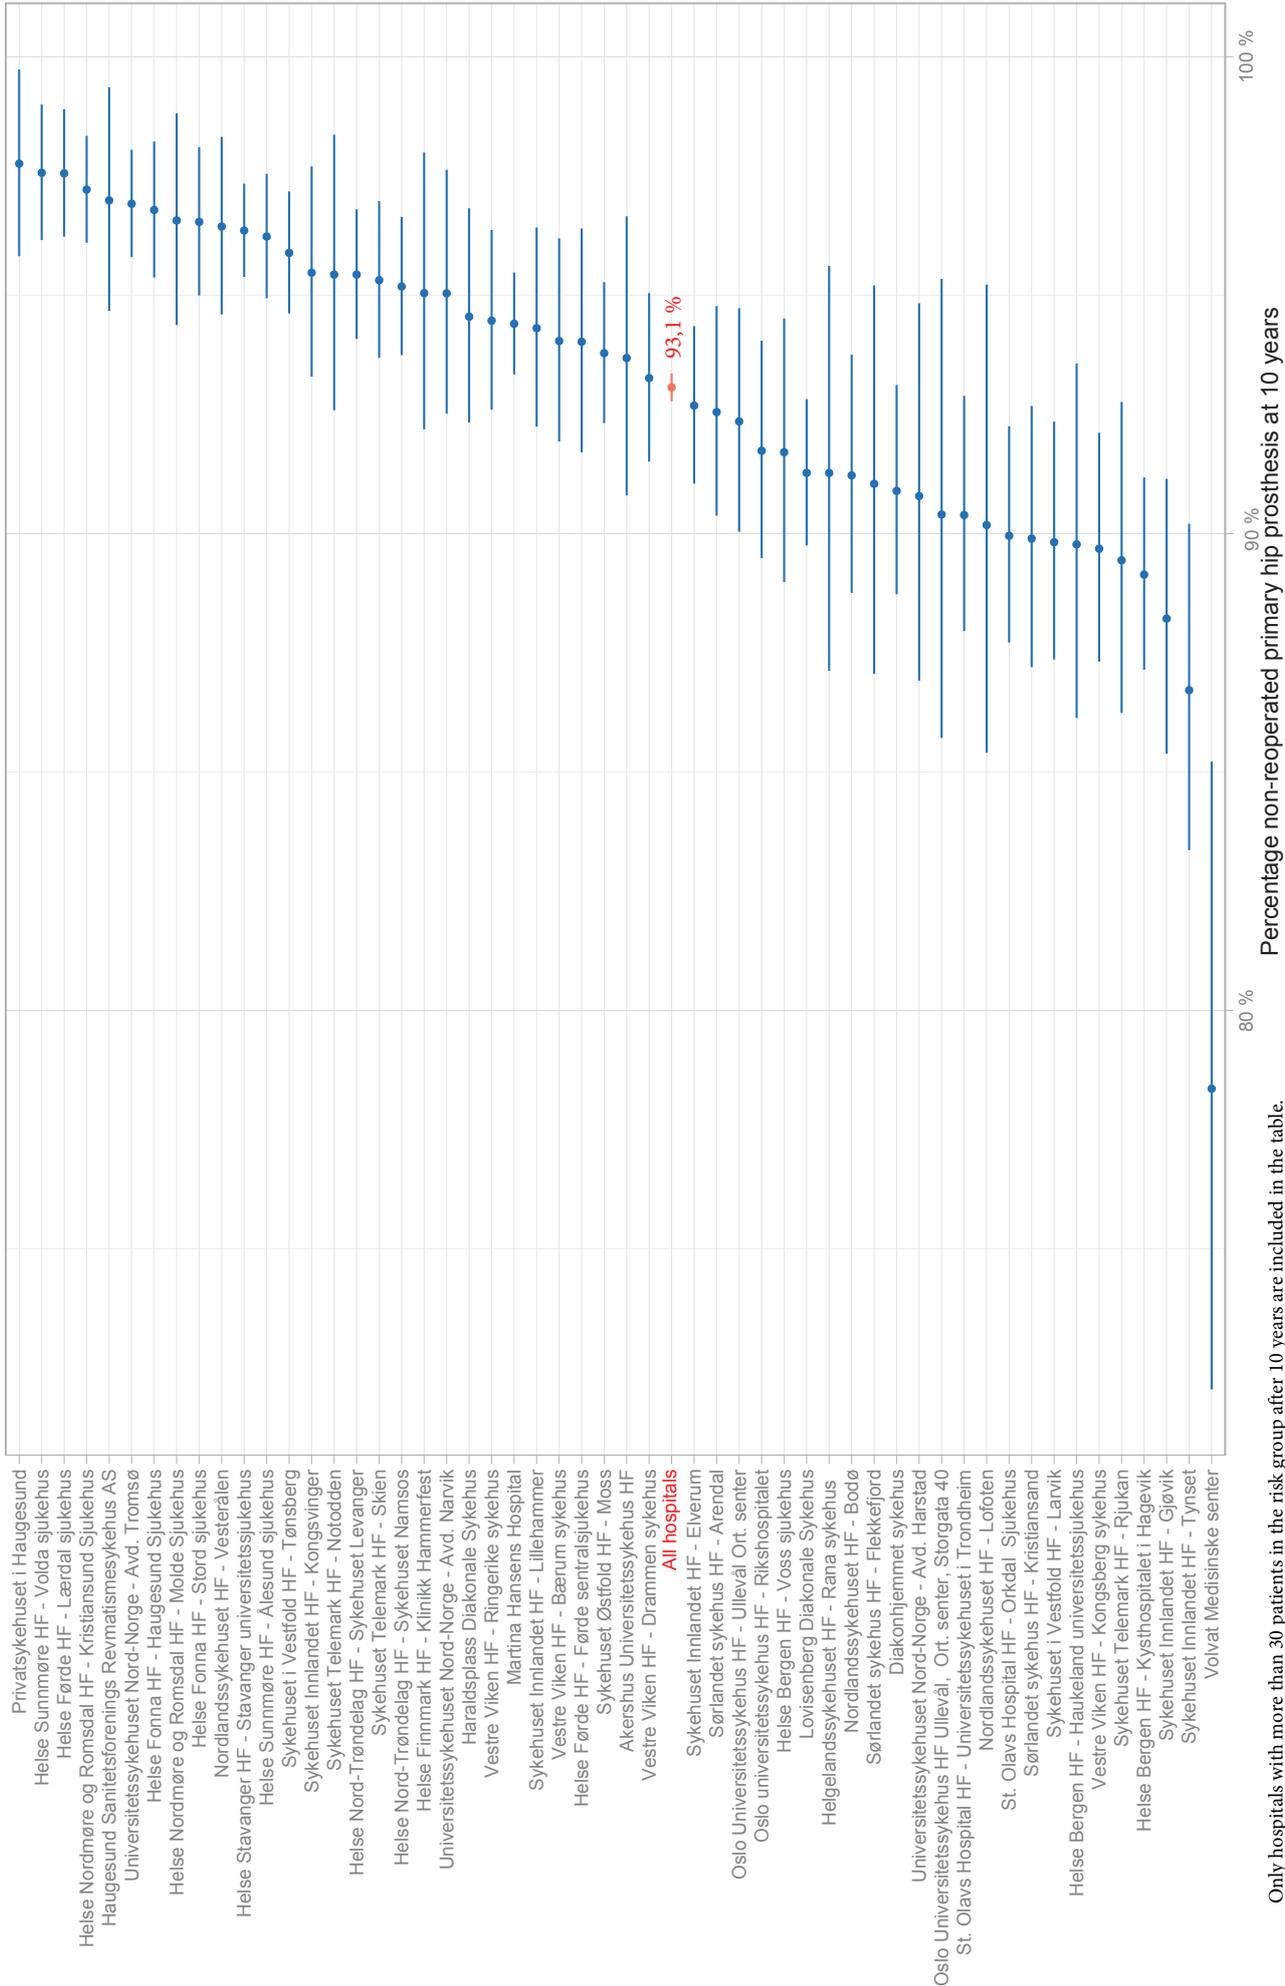

Ranking of hospitals

There is statistical uncertainty in the ranking lists because the data from the NAR are poorly suited for such calculations. The NAR was designed to compare the results of implants and surgical procedures nationwide. To compare quality in hospitals is a complex matter, because some hospitals operate on more patients with poor prognosis than other hospitals, and because many hospitals, especially the small ones, have so few reoperations that the statistics are too weak, and are further weakened by the fact that the hospitals' completeness (reporting rate) of reoperations varies from 16.7% to 100%. This issue is explained in detail in the following articles: Ranstam J, Wagner P, Robertsson O, Lidgren L. Health-care quality registers: outcome-orientated ranking of hospitals

is unreliable. *J Bone Joint Surg Br.* 2008 and Ranstam J, Wagner P, Robertsson O, Lidgren L. [Ranking in health care results in wrong conclusions]. *Läkartidningen.* 2008 Aug 27-Sep 2;105(35):2313-4.

Moreover, it is a well-known phenomenon in quality assurance that if those who report their complications and errors receive bad publicity, the reporting deteriorates. If league tables of hospitals are publicised, there is thus a danger that hospitals' reporting of reoperations may become less reliable, leading to inferior quality of the registers.

In order to achieve complete reporting of reoperations (revisions), reporting to the Register should be linked to performance-based financing, reporting should be made mandatory, and the requirement for the patient's written consent to reporting of the operation to the Register should be waived and replaced by presumed consent.

Only hospitals with more than 30 patients in the risk group after 10 years are included in the table.

ARTHROPLASTY OF THE KNEE AND OTHER JOINTS 2015 ANNUAL REPORT

In the period 1994-2014, a total of 68 317 knee replacements and 15 108 replacements of other joints than the hip and knee were recorded. There has been an increase of 11% in primary knee replacements since 2013. Osteoarthritis is the dominant cause of knee arthroplasties. The number of shoulder prostheses has increased by 14% since 2013, with an increase for both anatomic and reverse total shoulder prostheses. The number of hemiarthroplasties has remained almost constant.

NEW TABLES FOR KNEE PROSTHESES

We have created new tables for the use of fibrinolysis inhibitor, perioperative complications, previous surgery in the joints and the use of drains. A new and more detailed table of subtypes of the most commonly used total knee prostheses in the past two years has also been compiled.

QUALITY OF ARTHROPLASTY IN NORWAY

Survival curves show a gradual improvement since 1994 in results of total knee prostheses, where the endpoint is revision surgery. In a study based on our register data, hospitals that performed more than 100 knee arthroplasties per year had fewer reoperations than hospitals with a lower number of such operations (Badawy M 2013).

For the first time in many years, the results for unicondylar knee replacements have improved.

A study shows that hospitals with few operations per year have more reoperations than hospitals with over 40 operations annually (Badawy M 2014). We believe it would be an advantage to concentrate unicondylar replacements at a smaller number of hospitals.

More patients with osteoarthritis receive total shoulder prostheses. For these operations, recent years have seen a welcome improvement, with fewer reoperations than in previous years. The improvement is greatest for standard total anatomic prostheses. There is a worrying increase in revisions of cup prostheses (resurfacing)(Fevang BT2015).

For thumb joint prostheses (CMC I), results have deteriorated in recent years (Krukhaug Y 2014). The results for newer prostheses are no better than those for the old silicone prostheses, based on survival analysis. Scientific studies do not support widespread use of thumb joint prostheses.

For ankle prostheses, recent results are poorer. More ankle arthroplasties are being performed on patients with osteoarthritis and after injuries. These patients are younger and more often male than rheumatic patients. There is an urgent need for randomised trials to clarify which patients should have ankle prostheses and which patients should have arthrodesis surgery.

KNEE ARTHROPLASTY REVISIONS

There were 453 knee arthroplasty revisions reported to the Register in 2014. PhD candidate Tesfaye Leta is conducting a study of knee arthroplasty revisions. The first article was published in Acta 2015 (Leta T 2015). We found no statistically significant improvement in knee arthroplasty revisions in recent years, but a tendency towards better results with longer follow-up. Revision of the whole prosthesis gives better results than revision of individual components. 22% of prosthesis revisions are operated again after 10 years, and half of the reoperations take place within two years. Most early reoperations are because of infection and instability. Results for reoperations are significantly worse than for primary operations.

We find that the use of a stem is often not checked on the form. When a stem is used, it must be indicated whether it was a tibial or femoral stem, and a sticker must be attached to the back

of the form. Some prostheses use both a femoral and tibial stem, and if this is not checked, we have no way of knowing where the stem was used.

COMPLETENESS ANALYSIS AND PROSTHESIS SURVIVAL AT THE HOSPITAL LEVEL We publish completeness analyses for the years 2008-2012 for knee prostheses. These analyses are performed jointly by the Norwegian Patient Register/Directorate of Health (NPR), the Arthroplasty Register and the SKDE, and are scheduled for every second year. We are currently making completeness analyses for joints other than the hip and knee. An excerpt of the completeness rate at hospital level is published in this year's report, together with the individual hospitals' ten-year survival percentages for primary knee replacements. The analysis is unadjusted and published with an explanation of weaknesses. The arthroplasty registers record prosthetic interventions geographically by hospital, but the NPR cannot distinguish all individual hospitals under each hospital trust. Please ask the management at your hospital to create a special identification number for your hospital so that the NPR can recognise it. There is generally good reporting for primary prostheses, but some hospitals have poor reporting of revisions. The two hospitals with the lowest level of reporting of revisions reported only 50 percent of them. This means that the calculated risk of revision may be only half as high as the actual revision risk. Please remember to report revisions for infection and revisions with component removal. We encourage every hospital to study its coverage analysis. It should be a realistic goal to have over 95% of all revisions and 99% of primary operations reported by all hospitals. Please contact us if you need help to study the report, which is on the website of the Directorate of Health.

SUMMARY OF SIGNIFICANT SCIENTIFIC FINDINGS LAST YEAR

In the past year, we published an article on shoulder prostheses (Fevang BT 2015) showing that the revision results for shoulder prostheses have improved in recent years, particularly for anatomic total prostheses. The results were generally somewhat better for cemented implants. Results for cup prostheses (resurfacing) have deteriorated in recent years, and were especially poor for uncemented cup prostheses. Several RCTs have shown that the outcomes of conservative treatment and hemiarthroplasties are equally good for dislocated three or four fragment fractures. However, the use of reverse shoulder prostheses in acute fractures is increasing. There is a need for RCTs to study the efficacy of this type of prosthesis.

Cemented LCS rotating platform knee replacement leads to more aseptic loosening of the tibial component than fixed platform prostheses in Norway (Gøthesen Ø 2013). The first results from an analysis of retrieved prostheses, tissue and blood samples (retrieval analysis) in LCS Complete tibial components was presented at the EFORT meeting in 2014 (Kutzner I 2014, presentation). The loosening takes place between the prosthesis and the cement. It appears to be due to poor mechanical fixation and is not caused by wear particles. An article is in progress.

In an international partnership between six registers (International Consortium of Orthopaedic Registries - ICOR), we have been involved in three published articles on knee replacement. One study compared a rotating platform knee system (without posterior stabilisation) with a fixed-bearing PCR and found a 43% increase in revisions (RR 1.43 (1.36-1.51)) with a rotating platform knee system (Namba R 2014). This is the kind of knee prosthesis used in Norway and the results correspond with findings from Norway (Gøthesen 2013). In another study, fixed-bearing PCR was compared with posterior stabilised knee prosthesis (PS). Here, there were more revisions with the posterior stabilised knee. There were particularly poor

results if a patella component was not used in the PS knees. This study supports the use of fixed-bearing PCR, as in Norway. The study has only up to nine years of follow-up (Comfort T 2014). The third study compared fixed-bearing PS with rotating platform PS, and found that in the first two years the rotating platform had an 86% greater risk of revision than the fixed-bearing prosthesis (Graves S 2014). Neither of these types of knee prosthesis is commonly used in Norway.

Hilde Apold has published a study of 225 908 people, linking data from the Knee Arthroplasty Register and the Norwegian Health Surveys. The study shows that weight gain increases the risk of later knee replacement in both men and women. The effect of increased weight is greatest among young people (Apold H 2014). In another study, Apold showed that high BMI and work strain increased the risk of knee replacement (Apold H 2014). Apold defended her PhD thesis in February 2015. Congratulations!

Vanguard TM	196	0	0	0	0	0	195	13	0	196

Hybrid = Uncemented femur and cemented tibia

All poly = All polyethylene tibial component = whole plastic tibial component

HXLPE = Crosslinked plastic (Highly cross linked polyethylene)

MS = Minimally stabilized = Posterior cruciate retaining prostheses = (cruciate ligament retaining and deep dish)

PS = Posterior cruciate stabilizing prostheses = cruciate ligament replacement

CCK = Constrained Condylar Knee = stabilizing (high level)

* Surgeon checks for use of cement

ASA 1 = Healthy patients who smoke less than 5 cigarettes a day.

ASA 2 = Patients with an asymptomatic condition who are kept under medical control (f.ex. hypertension), or with diet (f. ex. diabetes mellitus type 2), and otherwise healthy patients who smoke five cigarettes or more daily.

ASA 3 = Patients having a condition that can cause symptoms. However, patients are kept under medical control (f. ex. moderate angina pectoris and mild asthma).

ASA 4 = Patients with a condition that is out of control (f. ex. heart failure and asthma).

ASA 5 = A moribund patient who is not expected to survive the operation.

Registration of ASA classification started in 2005

Completeness analysis for the Knee replacements in the Norwegian Arthroplasty Register (NAR), 2008-2012

A completeness analysis for the Knee Arthroplasty Register has been conducted by combining the data in the Register with data from the Norwegian Patient Register (NPR). The report and analysis were prepared by the NPR in collaboration with the Norwegian Arthroplasty Register (NAR). A report on the analysis and further results will be published on www.helsedirektoratet.no. There are separate statistics on primary operations and revisions. Some hospitals have few knee arthroplasty operations and the completeness must be seen in this light.

NCSF codes for combining data from NPR hospital stays and the Norwegian Arthroplasty Register

Type	Code	Description
Primary operation	NGB 0*	Primary partial prosthetic replacement of knee joint not using cement
	NGB 1*	Primary partial prosthetic replacement of knee joint using cement
	NGB 20	Primary total prosthetic replacement of knee joint not using cement
	NGB 30	Primary total prosthetic replacement of knee joint using hybrid technique
	NGB 40	Primary total prosthetic replacement of knee joint using cement
	NGB 99	Other primary prosthetic replacement of knee joint
Reoperation	NGC 0*	Secondary implantation of partial prosthesis in knee joint not using cement
	NGC 1*	Secondary implantation of partial prosthesis in knee joint using cement
	NGC 2*	Secondary implantation of total prosthesis in knee joint not using cement
	NGC 3*	Secondary implantation of total prosthesis in knee joint using hybrid technique
	NGC 4*	Secondary implantation of total prosthesis in knee joint using cement
	NGC 99	Other secondary prosthetic replacement in knee joint
	NGU 0*	Removal of partial prosthesis from knee joint
	NGU 1*	Removal of total prosthesis from knee joint

* All codes beginning with this in the NCSF

The completeness for the Norwegian Arthroplasty Register was calculated as follows:

$$\frac{\text{(Only NAR + Inclusion in both registers)}}{\text{(Only NAR + Only NPR + Inclusion in both registers)}}$$

Completeness for the NPR was calculated in a similar way:

$$\frac{\text{(Only NPR + Inclusion in both registers)}}{\text{(Only NAR + Only NPR + Inclusion in both registers)}}$$

Primary operations. From 2008 to 2012, 23 352 primary knee replacements were reported to one or both of the registers. 95.3% of these were reported to the NAR, while 97.6% were reported to the NPR. The analysis by hospital, divided into health regions, shows a completeness for the Norwegian Arthroplasty Register ranging from 78.3% to 100% between the different hospitals (Tables 38-42). For hospitals with a low completeness for the Norwegian Arthroplasty Register, either the form was not sent in or other interventions than knee arthroplasties were incorrectly coded with NGB0*/NGB1*/NGB20/NGB30/NGB40 (There were only 92 operations in the category NGB99 during the period).

Procedure codes to be used for primary operations:

NGB 0* - NGB 1* - NGB 20 - NGB 30 - NGB 40

Revision operations. From 2008 to 2012, 2393 revisions were reported to one or both of the registers. 88.9% of these were reported to the NAR, while 88.5% were reported to the NPR. The completeness by hospital is presented in Tables 38 to 42, showing that the completeness for the Norwegian Arthroplasty Register varied between 48% and 100%. A low completeness may mean that the form was not sent in. It appears that a number of revision forms are missing in cases where the prosthesis was removed without a new one being inserted in the same operation; in such cases, a form should be submitted both when the prosthesis is removed and when any new insertion is performed.

Procedure codes to be used for revision operations:

NGC 0* - NGC 1* - NGC 2* - NGC 3* - NGC 4* - NGC 99 - NGU 0* - NGU 1*

New: From 2012, revisions due to infection, even where parts of the prosthesis are not removed or replaced, are to be reported on the form to the NAR. These must be coded NGS 19, NGS 49 or NGW 69.

KNEE ARTHROPLASTY SURVIVAL RATES IN NORWEGIAN HOSPITALS

For the first time, we present ten-year survival rates for arthroplasties performed at hospitals in Norway. We have included prostheses from 2003-2014 from hospitals with more than 50 operations during this period. The Kaplan-Meier method with a 95% confidence interval was used. We provide the unadjusted rate for all types of knee replacements (total knee prostheses, unicondylar and hinged). Only hospitals that performed operations in 2014 are included.

The results must be interpreted with caution, because differences in reoperation rates may be due to a number of factors:

1. Hospitals that are more rigorous in reporting their complications and reoperations to the Register could have unfairly negative results in the analysis.
2. If surgeons at one hospital are more diligent in facilitating check-ups for patients than at other hospitals, and thus discover more complications, this could lead to unfortunate results despite the fact that this hospital in reality is doing a better job than other hospitals.
3. If the waiting time for reoperations is longer in some hospitals than others, the longer wait could erroneously lead to better results than those of hospitals with a short waiting time.
4. If the surgeons at one hospital have a higher threshold for recommending reoperation than at other hospitals and thus prolong patients' problems, this will also give skewed results in the statistics.
5. Poor hospital results from an earlier period will remain with the hospital, even though the hospital may have acted upon previous problems by switching to better prostheses and improving procedures and surgical skills.

The completeness analysis shows the proportion of primary operations and revisions each hospital has reported to NPR. If the completeness of revisions is low in a hospital, it may indicate that the result found in our survival analysis is too high.

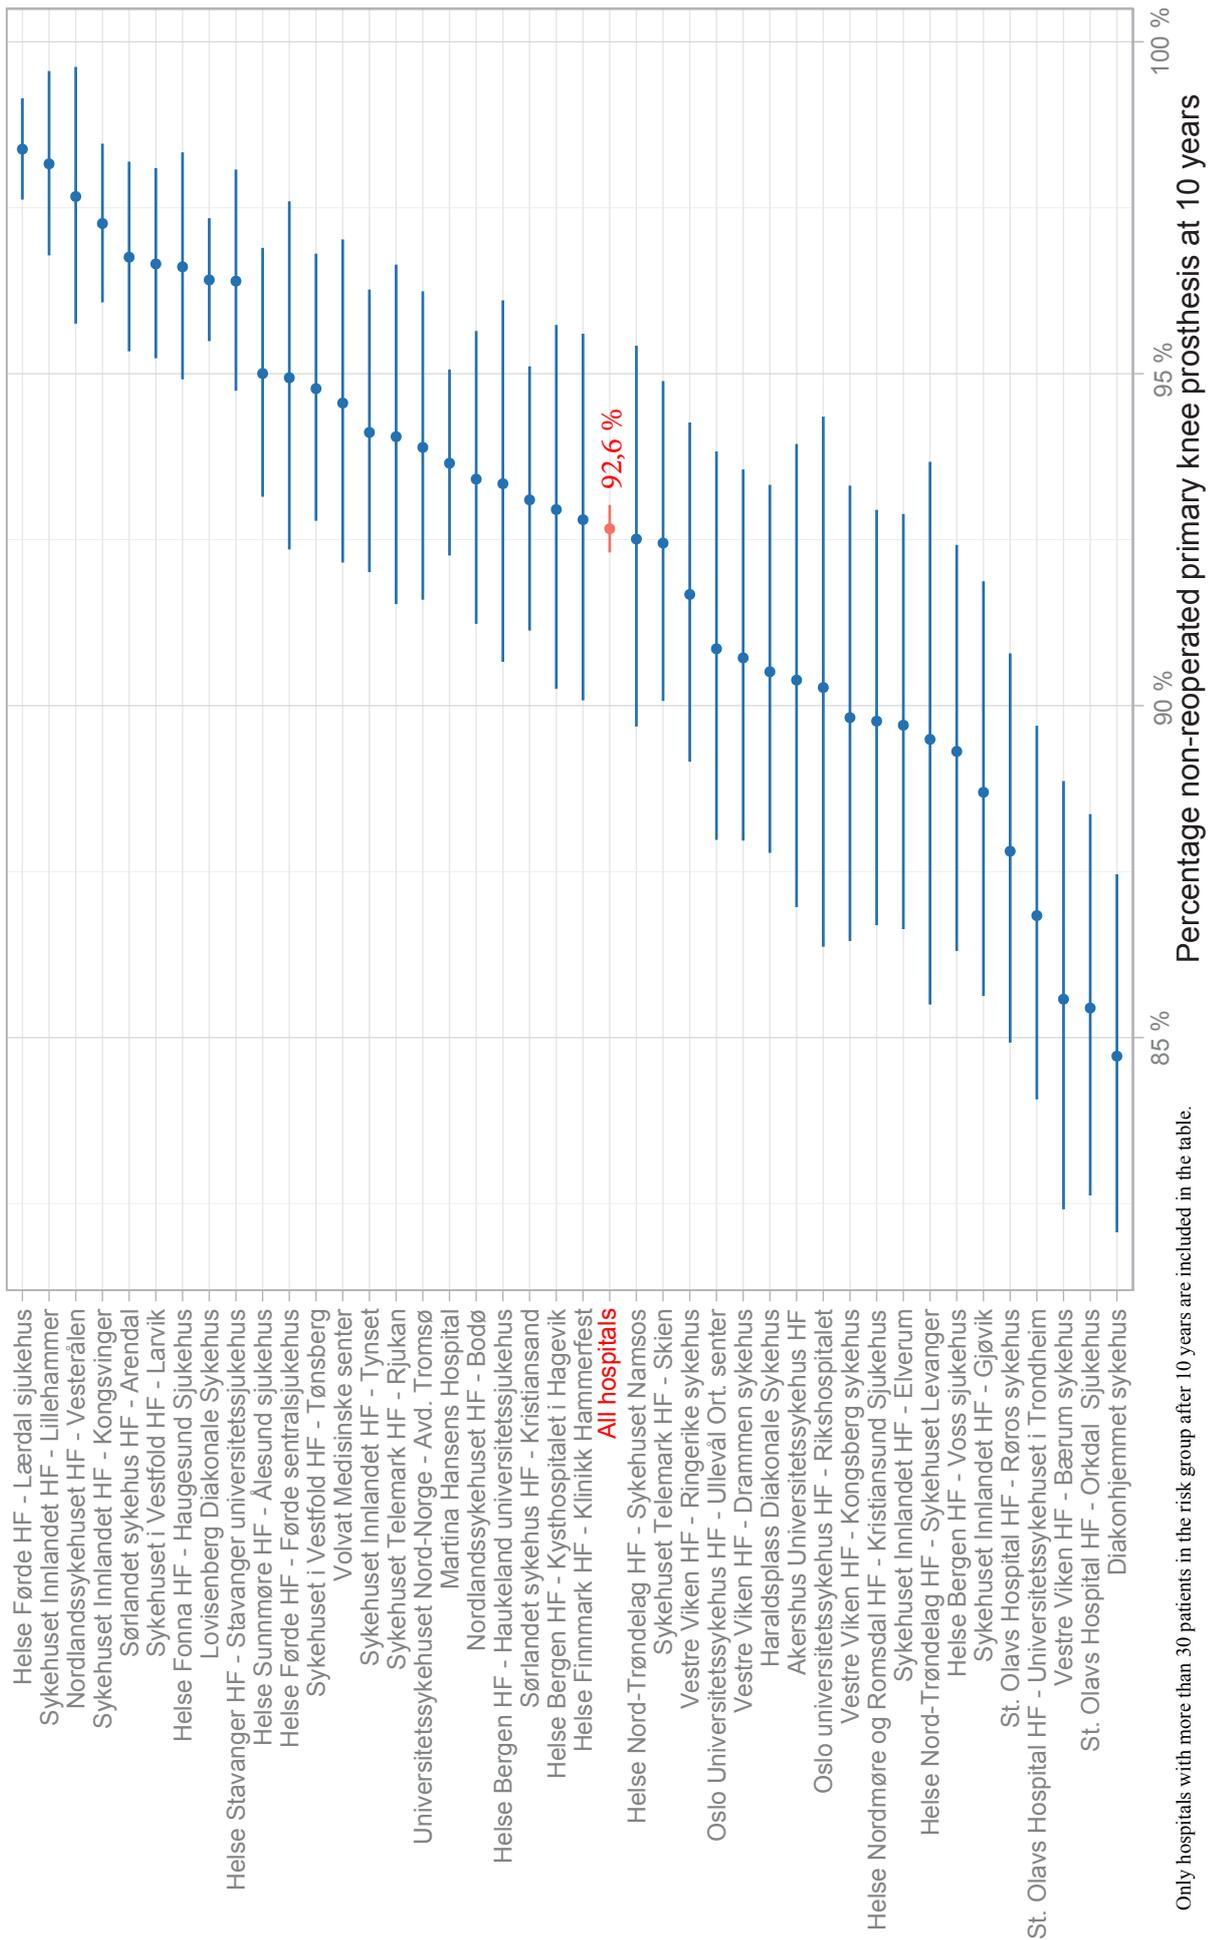

Ranking of hospitals

There is statistical uncertainty in the ranking lists because the data from the NAR are poorly suited for such calculations. The NAR was designed to compare the results of implants and surgical procedures nationwide. To compare quality in hospitals is a complex matter, because some hospitals operate on more patients with poor prognosis than other hospitals, and because many hospitals, especially the small ones, have so few reoperations that the statistics are too weak, and are further weakened by the fact that the hospitals' completeness (reporting rate) of reoperations varies from 0% to 100%. This issue is explained in detail in the following articles: Ranstam J, Wagner P, Robertsson O, Lidgren L. Health-care quality registers: outcome-orientated ranking of hospitals is unreliable.

J Bone Joint Surg Br. 2008 and Ranstam J, Wagner P, Robertsson O, Lidgren L. [Ranking in health care results in wrong conclusions]. Läkartidningen. 2008 Aug 27-Sep 2;105(35):2313-4.

Moreover, it is a well-known phenomenon in quality assurance that if those who report their complications and errors receive bad publicity, the reporting deteriorates. If league tables of hospitals are publicised, there is thus a danger that hospitals' reporting of reoperations may become less reliable, leading to inferior quality of the registers.

In order to achieve complete reporting of reoperations (revisions), reporting to the Register should be linked to performance-based financing, reporting should be made mandatory, and the requirement for the patient's written consent to reporting of the operation to the Register should be waived and replaced by presumed consent.

Only hospitals with more than 30 patients in the risk group after 10 years are included in the table.

THE NORWEGIAN HIP FRACTURE REGISTER ANNUAL REPORT 2015

The annual number of primary hip fracture operations continues to show a downward trend. Since 2011, we have seen a reduction of about 200 fractures per year (Table 1). This is surprising, since the number of elderly people in society is increasing. Does it indicate that the incidence of hip fractures is falling? An alternative explanation could be poorer reporting to the Hip Fracture Register, but there are no other indications of this, to our knowledge.

Completeness analyses (i.e. validation) of reporting to the Hip Fracture Register (NHFR), compared to the Norwegian Patient Register (NPR), were published in last year's annual report. This validation was for the period 2008-2012 and showed good and stable reporting to NHFR with 94% reporting for primary hemiarthroplasty and 86% reporting for primary osteosynthesis, but only 63% for reoperations.

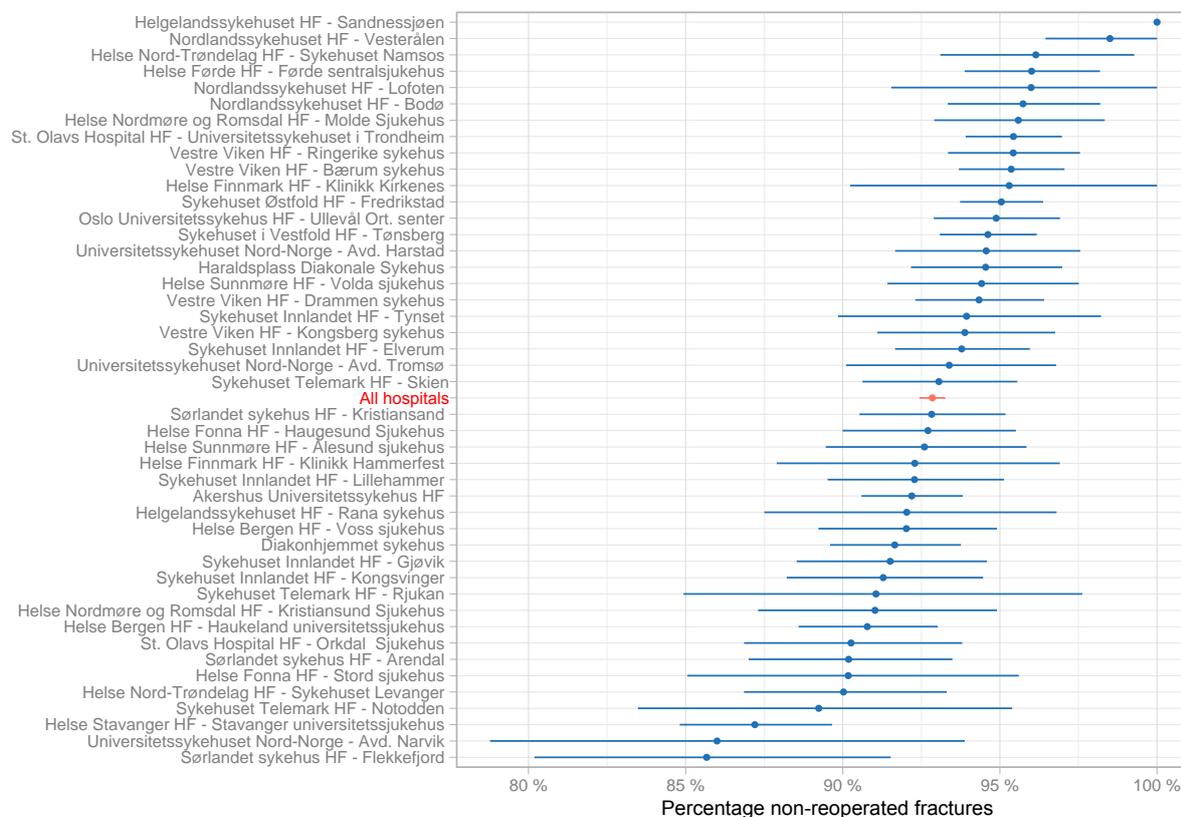

We are about to complete a study of reporting for 2012 from eight of the 54 Norwegian hospitals where hip fracture surgery was performed. To determine the correct number of hip fractures, each hospital's records system, operation protocol, radiographic images and patient administrative system were studied. Preliminary figures show that 93% of all hip fractures from these hospitals were reported to the NHFR. This gives us reason to trust the numbers in the NHFR.

New in this year's report is the publication of the number of hip fracture operations reported from all Norwegian hospitals for 2014. A corresponding figure with the numbers for 2013 was published in the SKDE report for 2014 (<http://www.kvalitetsregistre.no/resultater/>).

The figure below shows the estimated proportion, with 95% confidence interval, of non-reoperated fractures within two years for patients who underwent surgery for hip

fractures at the various hospitals in Norway in the period 2012-2014. (The SKDE report for last year contained a similar figure for the period 2008-2010). Hospitals with fewer than 10 hip fracture operations during this three-year period have been excluded from this figure.

When hospitals are ranked according to the percentage of reoperations, the results must be interpreted with great caution, because there may be many reasons for differences in the reoperation percentage:

1. Hospitals that are more rigorous in reporting their complications and reoperations to the Register could have unfairly negative results in the analysis.
2. If surgeons at one hospital are more diligent in facilitating check-ups for patients than at other hospitals, and thus discover more complications, this could lead to unfortunate results despite the fact that this hospital in reality is doing a better job than other hospitals.
3. If the waiting time for reoperations is longer in some hospitals than others, the longer wait could erroneously lead to better results than those of hospitals with a short waiting time.
4. If the surgeons at one hospital have a higher threshold for recommending reoperation than at other hospitals and thus prolong patients' problems, this will also give skewed results in the statistics.

There is also statistical uncertainty in the ranking lists because the data in our registers are poorly suited for such calculations. The registers were created in order to compare the results of implants and surgical procedures nationwide. To compare quality in hospitals is a complex matter, because some hospitals operate on more patients with poor prognosis than other hospitals, and because many hospitals, especially small ones, have so few reoperations that the statistics are too weak, and are further weakened by the fact that the hospitals' completeness (reporting rate) of reoperations varies from 14.6% to 100%.

The year 2014 was successful from an operational and scientific point of view. Four scientific articles with data from the Hip Fracture Register were published and many national and international presentations were held.

The surgeons are still jointly in charge of the data in the Hip Fracture Register, and we encourage anyone interested in research to contact us at the Register.

We would like to thank you all for good reporting and we look forward to continued good cooperation!

2005	5898 (83,3%)	1184 (16,7%)	7082
Total	79775 (88,1%)*	10806 (11,9%)**	90581

51% of primary operations were on the right side. 70% of primary operations were performed on women. Mean age at primary surgery was 80 years: 82 years for women and 77 years for men.

* 1975 (2%) were primary operations with total hip prostheses from the Norwegian Arthroplasty Register.

** 4875 (45%) were reoperations with total hip prostheses from the Norwegian Arthroplasty Register.

Figure 7: ASA classification - all operations

ASA 1: Healthy patients who smoke less than 5 cigarettes a day.

ASA 2: Patients with an asymptomatic condition who are kept under medical control (f.ex. hypertension), or with diet (f. ex. diabetes mellitus type 2), and otherwise healthy patients who smoke five cigarettes or more daily.

ASA 3: Patients having a condition that can cause symptoms. However, patients are kept under medical control (f. ex. moderate angina pectoris and mild asthma).

ASA 4: Patients with a condition that is out of control (f. ex. heart failure and asthma).

ASA 5: A moribund patient who is not expected to survive the operation.

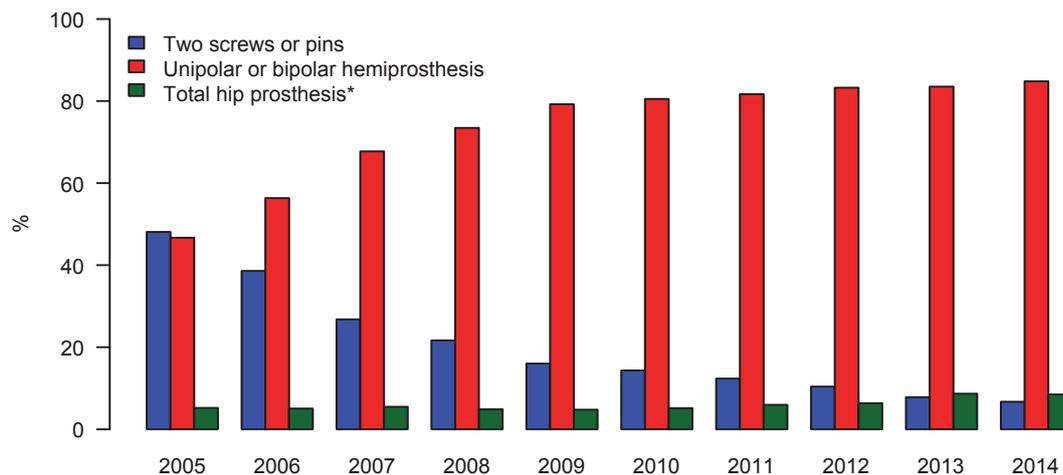

Figure 8: Type of primary operations - all fractures

- T1: Two screws or pins
- T2: Three screws or pins
- T3: Bipolar hemiprosthesis
- T4: Unipolar hemiprosthesis
- T5: Hip compression screw and plate
- T6: Hip compression screw with lateral support plate
- T7: Angle plate
- T8: Short intramedullary nail without distal locking
- T9: Short intramedullary nail with distal locking
- T10: Long intramedullary nail without distal locking
- T11: Long intramedullary nail with distal locking
- T12: Total hip prosthesis
- T13: Other*
- T14: Missing

* Proportion (%) of operations with combination: Hip compression screw system and additional anti-rotational screw is 1,3 %

Figure 9a: Time trend for treatment of displaced femoral neck fractures

* Total hip prostheses for femoral neck fracture were reported to the Norwegian Arthroplasty Register without information about dislocation fracture

Figure 9b: Time trend for treatment of trochanteric fractures

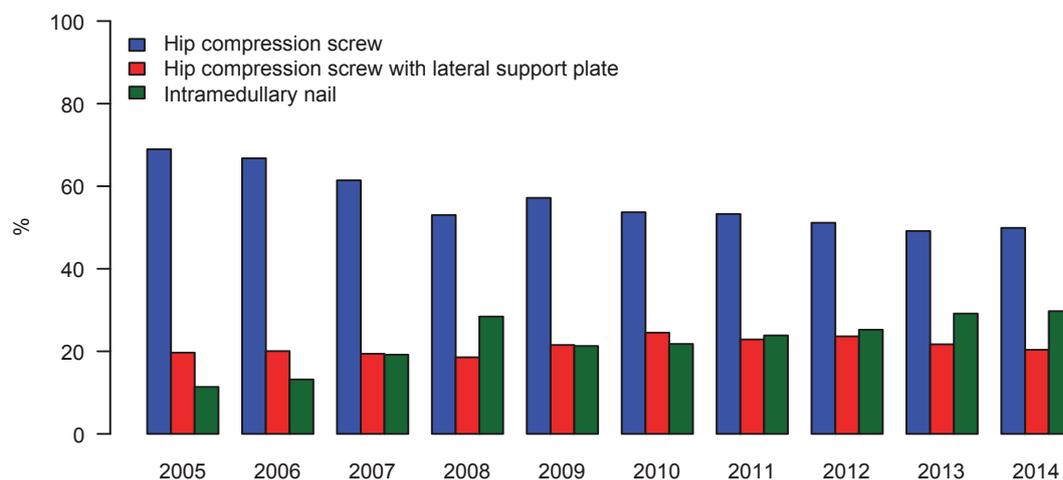

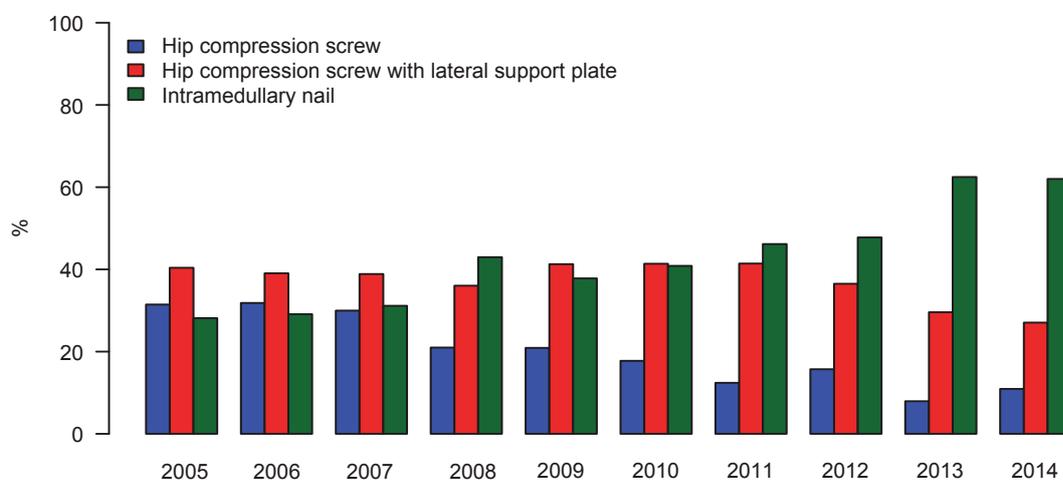

Figure 9c: Time trend for treatment of inter-* and subtrochanteric fractures

* Intertrochanteric fracture (AO OTA type A3)

Figure 10a: Quality of life (EQ-5D) among patients with hip fractures

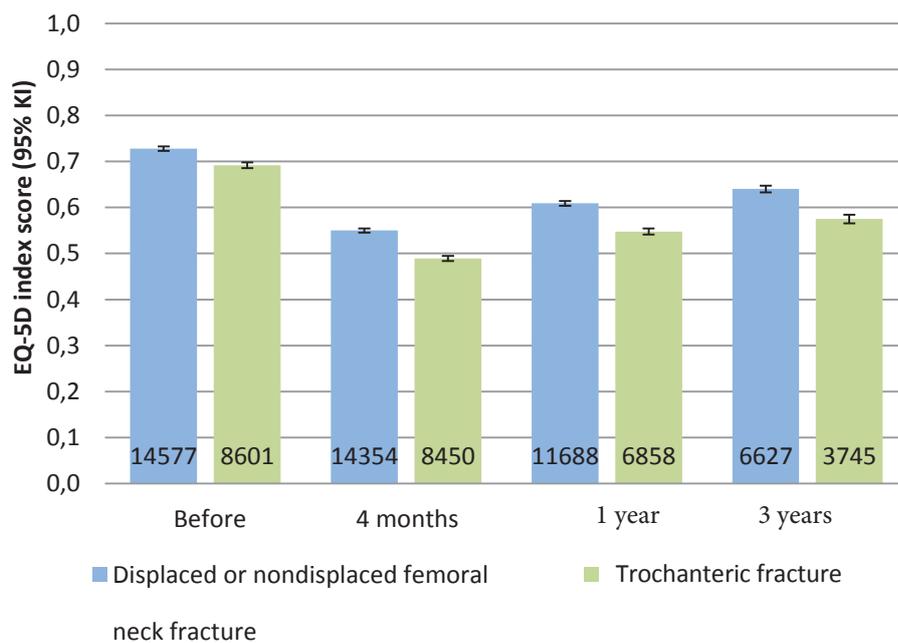

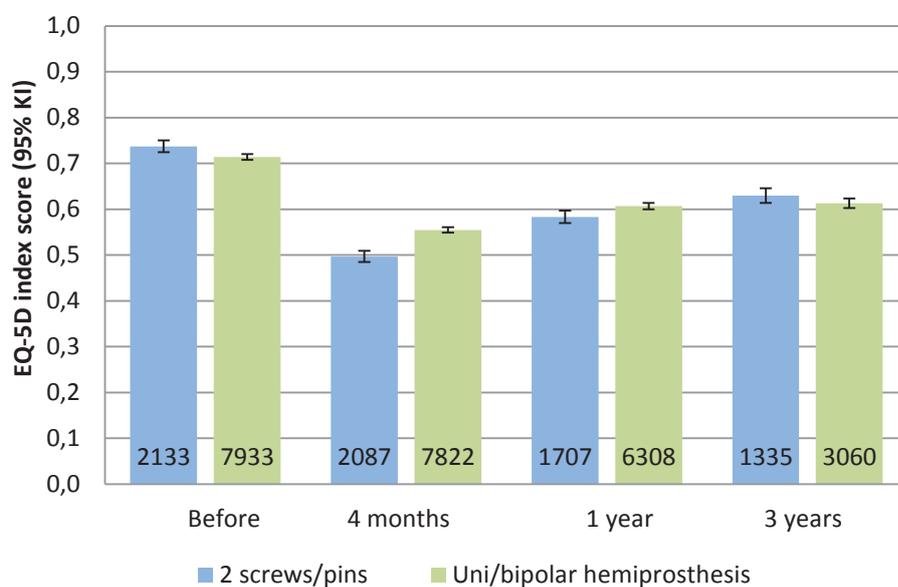

Figure 10b: Quality of life (EQ-5D) among patients with displaced femoral neck fracture

The numbers in each column indicate the numbers of patients who had answered the quality of life questionnaire at each follow up.

Reoperations

Table 9: Reasons for reoperation (more than one reason is possible)

R1: Osteosynthesis failure

R2: Nonunion

R3: Avascular necrosis (segmental collapse)

R4: Local pain due to osteosynthesis material

R5: Malunion

R6: Infection - superficial

R7: Infection - deep

R8: Haematoma

R9: Dislocation of hemiprosthesis

R10: Penetration of osteosynthesis material through caput

R11: New fracture around implant

R12: Loosening of hemiprosthesis

R13: Other

R14: Reported reoperations to the Arthroplasty Register except "Deep infection" which is included in R7: Infection – deep.

Table 10: Numbers of reoperation for each type of primary fracture

In patients where both primary operation and the related reoperation are registered.
Multiple causes for each reoperation can be registered.

		Type of primary fracture								
		Intracapsular fracture, undischanced	Intracapsular fracture, displaced	Basocervical fracture	Trochanteric fracture (2 fragments)	Trochanteric fracture (multifragment)	Subtrochanteric fracture	Intertrochanteric fracture*	Other	Missing
Reasons for reoperation	Osteosynthesis failure	495	600	106	104	199	101	28	12	1
	Nonunion	211	235	46	35	84	50	7	5	1
	Avascular necrosis (segmental collaps)	161	150	23	15	17	2	2	2	0

DURATION OF SURGERY

Figure 13: Duration of surgery for the different types of operations

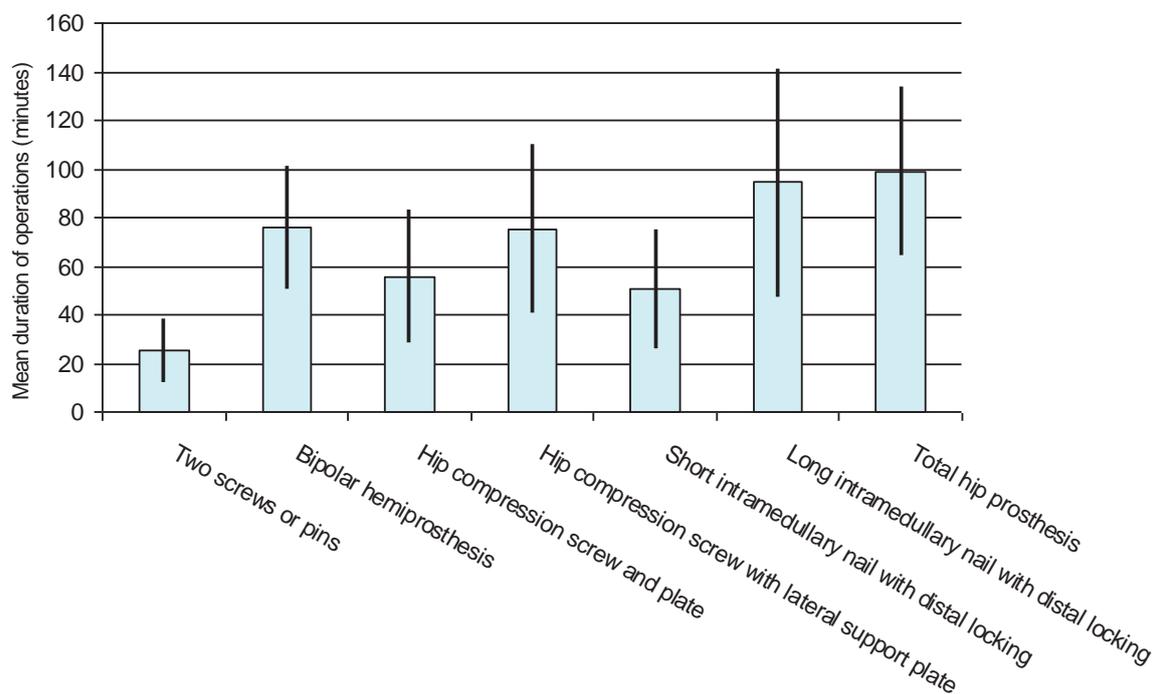

Table 38: Duration of surgery for the different types of operations

Type of operations	Total	Mean duration of operations (minutes)	Standard deviation
Two screws or pins	16732	25	13
Bipolar hemiprosthesis	24279	76	25
Hip compression screw and plate	16128	56	27
Hip compression screw with lateral support plate	6978	75	34
Short intramedullary nail with distal locking	5159	51	24
Long intramedullary nail with distal locking	2420	94	47
Total hip prosthesis	1917	99	35

Completeness analysis for the Norwegian Hip Fracture Register, 2008-2012

A completeness analysis for the Norwegian Hip Fracture Register (NHFR) has been conducted by combining the data in the Register with data from the Norwegian Patient Register (NPR). The report and analysis were prepared by the NPR in collaboration with the NHFR. A report on the analysis and results will be published on www.helsedirektoratet.no. There are separate statistics for primary hemiarthroplasty and osteosynthesis, and for the total number of revisions.

NCSP codes for combining data from NPR hospital stays and the Hip Fracture Register

Type	Code	Description
Primary hemi-arthroplasty	NFB 00	Primary partial prosthetic replacement of hip joint not using cement; all parts
	NFB 02	Primary partial prosthetic replacement of hip joint not using cement; single part - distal
	NFB 09	Primary partial prosthetic replacement of hip joint not using cement; other or unspecified
	NFB 10	Primary partial prosthetic replacement of hip joint using cement; all parts
	NFB 12	Primary partial prosthetic replacement of hip joint using cement; single part - distal
	NFB 19	Primary partial prosthetic replacement of hip joint using cement; other or unspecified
Osteosynthesis	NFJ0 (0,1,2,3)	Closed reduction of fracture of femur
	NFJ1 (0,1,2,3)	Open reduction of fracture of femur
	NFJ2 (0,1,2,3)	External fixation of fracture of femur
	NFJ3 (0,1,2,3)	Internal fixation of fracture of femur using bioimplant
	NFJ4 (0,1,2,3)	Internal fixation of fracture of femur using wire, rod, cerclage or pin
	NFJ5 (0,1,2,3)	Internal fixation of fracture of femur using intramedullary nail
	NFJ6 (0,1,2,3)	Internal fixation of fracture of femur using plate and screws
	NFJ7 (0,1,2,3)	Internal fixation of fracture of femur using screws alone
	NFJ8 (0,1,2,3)	Internal fixation of fracture of femur using other or combined methods
NFJ9 (0,1,2,3)	Other fracture surgery of femur	
Revision	NFC 0*	Secondary implantation of partial prosthesis in hip joint not using cement
	NFC 1*	Secondary implantation of partial prosthesis in hip joint using cement
	NFC 59	Secondary implantation of interposition prosthesis in hip joint
	NFG 09	Excision arthroplasty of hip joint
	NFH 4*	Removal of foreign or loose body from hip joint
	NFH 22	Open reduction of dislocation prosthesis of hip joint
	NFL 19	Suture or plastic repair of muscle of hip or thigh
	NFL 99	Other operation on muscle or tendon of hip or thigh
	NFN 09	Autograft of bone to femur
	NFN 19	Allograft of bone to femur
	NFN 29	Xenograft of bone to femur
	NFU 0*	Removal of partial prosthesis from hip joint
	NFU 49	Removal of internal fixation device from femur
	NFU 89	Removal of therapeutic implant in treatment of infection of hip or femur
	NFB 00	Primary partial prosthetic replacement of hip joint not using cement; all parts
	NFB 02	Primary partial prosthetic replacement of hip joint not using cement; single part - distal
	NFB 09	Primary partial prosthetic replacement of hip joint not using cement; other or unspecified
	NFB 10	Primary partial prosthetic replacement of hip joint using cement; all parts
	NFB 12	Primary partial prosthetic replacement of hip joint using cement; single part - distal
	NFB 19	Primary partial prosthetic replacement of hip joint using cement; other or unspecified
	NFJ0 (0,1,2,3)	Closed reduction of fracture of femur
	NFJ1 (0,1,2,3)	Open reduction of fracture of femur
	NFJ2 (0,1,2,3)	External fixation of fracture of femur
	NFJ3 (0,1,2,3)	Internal fixation of fracture of femur using bioimplant
	NFJ4 (0,1,2,3)	Internal fixation of fracture of femur using wire, rod, cerclage or pin
	NFJ5 (0,1,2,3)	Internal fixation of fracture of femur using intramedullary nail
	NFJ6 (0,1,2,3)	Internal fixation of fracture of femur using plate and screws
	NFJ7 (0,1,2,3)	Internal fixation of fracture of femur using screws alone
NFJ8 (0,1,2,3)	Internal fixation of fracture of femur using other or combined methods	
NFJ9 (0,1,2,3)	Other fracture surgery of femur	

* All codes beginning with this in the NCSP

The completeness rate for the Hip Fracture Register was calculated as follows:

$$\frac{(\text{Only NHFR} + \text{Inclusion in both registers})}{(\text{Only NPR} + \text{Only NHFR} + \text{Inclusion in both registers})}$$

Completeness for the NPR was calculated in a similar way:

$$\frac{(\text{Only NPR} + \text{Inclusion in both registers})}{(\text{Only NHFR} + \text{Only NPR} + \text{Inclusion in both registers})}$$

Primary operations

Primary hip fracture surgery should be reported to the NPR with the NCSP procedure codes shown in the table and the ICD-10 codes S72.0, S72.1, S72.2 or S72.3.

From 2008 to 2012, 16 154 hemiarthroplasties were reported to one or both of the registers. 94.2% of these were reported to the NHFR, while 81.8% of these were reported to the NPR. Reporting of hemiarthroplasties to the NHFR is over 80% from all hospitals except one, see Tables 38-41.

In the same period, there were 30 932 reports of internal fixation for hip fracture; 86.4% of these were to the NHFR and 92.3% to the NPR. Completeness by hospital is presented in Tables 38 to 42, divided into health regions; these show that reporting of internal fixation to the NHFR varies between hospitals from 54% to 98%. Almost a third of hospitals have a completeness rate of below 80%, which we find very low.

For hospitals with a low completeness rate for the NHFR, the form may not have been submitted to the Register, and one possible reason for this is that the patient has not given or been able to give consent. The difference in completeness between primary hemiarthroplasty and internal fixation shows that this cannot be the sole reason and that hospitals must be more aware of internal fixation and report it regularly to the NHFR. Another factor affecting the completeness rate is that other interventions than hip fracture surgery may have been incorrectly coded with the NCSP and ICD-10 codes mentioned above.

Revision operations

Revision surgery after hip fracture should be reported to the NPR with the NCSP procedure codes given in the table and one or more of the ICD-10 codes M84, M86, M87.2, T81.0, T81.3, T81.4, T81.5, T81.6, T81.7, T81.8, T81.9, T84.0, T84.1, T84.2, T84.5, T84.6, T84.7, T84.8, T84.9, T93.1.

From 2008 to 2012, 8426 revisions were reported to one or both of the registers. 62.8% of these were reported to the NHFR, while 52.9% were reported to the NPR. Completeness by hospital is presented in Tables 38 to 42, showing that the completeness rate for the NHFR for the various hospitals (with over ten revisions) ranged between 15% and 91%. The reoperation figures are uncertain, partly because some revision hemiarthroplasties are erroneously reported to the NPR as primary operations. If a hemiprosthesis is inserted after a failed internal fixation of a femoral neck fracture, this is a sequela after hip fracture, even though it is the first hemiprosthesis inserted. A low completeness rate may also mean that the revision form was not submitted to the NHFR, or that other interventions have been incorrectly coded with the codes in the table above.

CRUCIATE LIGAMENT REGISTER 2015 ANNUAL REPORT

The past year has been marked by some “bureaucratic” innovations. SKDE (the Centre for Clinical Documentation and Evaluation) will now receive an annual report from the Cruciate Ligament Register, which was assessed as Stage 3 by the SKDE. This is the second highest stage; only eight registers were assessed as Stage 3, and none of the Norwegian quality registers achieved Stage 4.

One of the main reasons why we did not reach Stage 4 is the lack of electronic submission of the “ACL form” and the KOOS form that patients submit.

We have been working at creating electronic submission of forms for a long time. The main reason that this has taken time is the problem of authentication, i.e. the use of computers, to get a code via text message and mobile phone before the form can be registered and sent to the database. We have had demonstrations of other versions without authentication, but all feedback indicates that we cannot avoid authentication if we are to remain a national quality register.

MRS (Medical Registration System), developed by HEMIT, was validated during 2014, suggesting that it will be employed. It is almost complete regarding the “ACL form”, and will be adopted by Haukeland Hospital for a trial period beginning in early autumn 2015.

There is considerable research activity. The article “Increased risk of revision with hamstring tendon grafts compared with patellar tendon grafts after anterior cruciate ligament reconstruction” by Andreas Persson and colleagues was published in AJSM in February 2014. Also published was the article by Tone Gifstad and colleagues “Lower risk of revision with patellar tendon autografts compared with hamstring autografts”, which is based on Scandinavian cruciate ligament registers. This has led to a change in procedures, as more surgeons are now using patellar tendon autografts.

Tone Gifstad from St Olav’s Hospital defended her thesis entitled “Results after ACL reconstruction - Clinical and registry-based studies”, based on data from the Norwegian, Swedish and Danish cruciate ligament registers.

We have had excellent collaboration with Kaiser Permanente in the United States, and we have been cooperating on articles with the MOON group, also in the US. Cooperation with French, Norwegian and North American researchers has led to another article. The Scandinavian registers in Sweden, Denmark and Norway have joint articles and also articles based on cooperation between two of the countries. This cooperation is primarily thanks to the researchers at the Oslo Sports Trauma Research Centre. Many thanks go to Professor Lars Engebretsen and Lars-Petter Granan, the principal driving forces in this research environment.

In 2014, there were 1654 primary operations (a slight decrease from the previous year) and 247 revisions (up from 2013). For other procedures, the figure is very low (141) and, as in previous years, we believe this is considerably underreported. It is a big challenge to get people to send in the forms. This is also a problem in the corresponding registers in other countries.

SKDE requires results from the Register to be publicised. The various quality registers are now publicly available on the web site: **kvalitetsregistre.no**

Håvard Moksnes, Lars Engebretsen and Romain Seil have started a project called “ESSKA - Pediatric ACL Monitoring Initiative (PAMI)”, based on Håvard Moksnes’ article “The current evidence for treatment of ACL injuries in children is low”.

The forms will probably have to be changed again soon. This is only natural, and may be easier when they are electronic.

We would like to thank all our colleagues who regularly send in the forms. Without them, it would be impossible to perform our work satisfactorily.

Our goal is to reach Stage 4, the highest ranking by SKDE, as soon as possible.

Survival for cruciate ligament operations

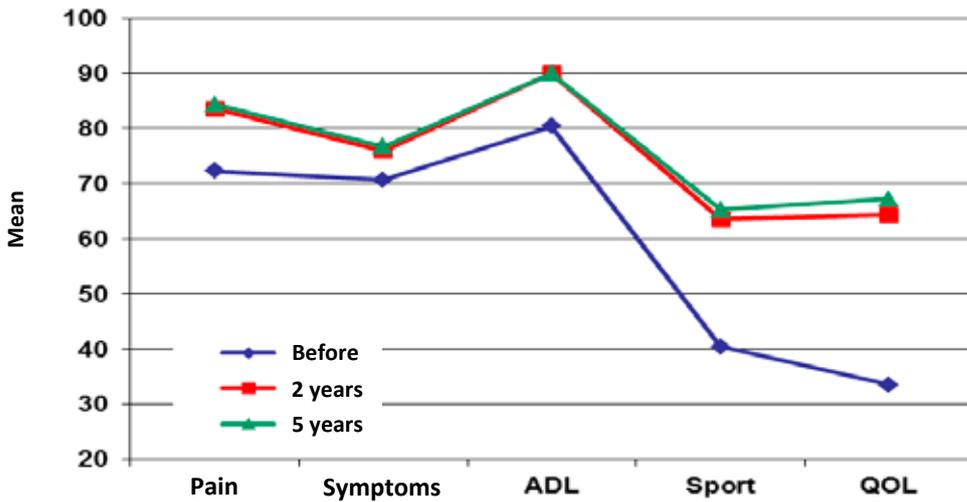

Survival estimate is given as long as >20 reconstructions remains at risk.

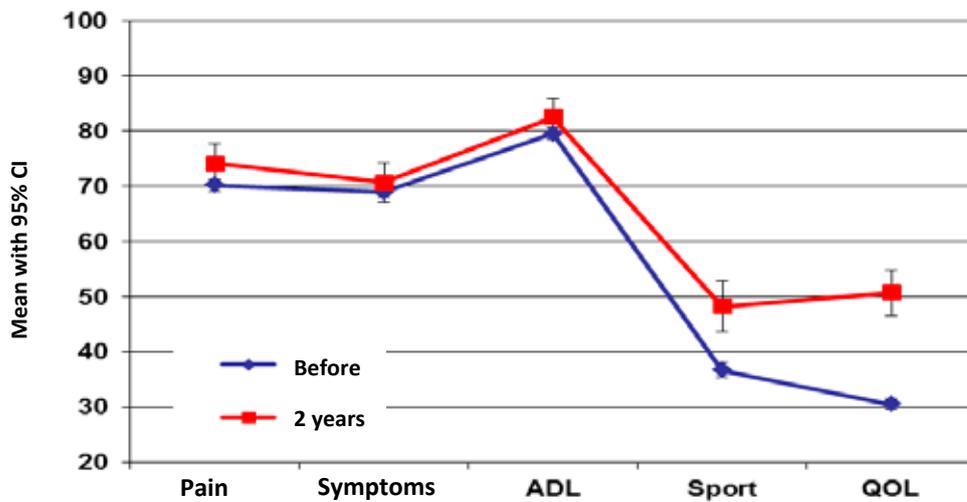

KOOS with primary ACL reconstruction without additional injury

KOOS with primary ACL reconstruction with additional injury

KOOS with revision reconstructions

KOOS = Knee Injury and Osteoarthritis Outcome Score. ADL = Function in daily living. QOL = Quality of life. Number of patients included in the calculations may vary over time. CI = confidence interval.

Cruciate Ligament

All categories of operations

Table 1: Annual numbers of operations

	Primary reconstruction	Revision reconstruction	Only other procedures	Total
2014	1654 (81,0%)	247 (12,1%)	141 (6,9%)	2042
2013	1754 (84,0%)	207 (9,9%)	128 (6,1%)	2089
2012	1771 (83,5%)	220 (10,4%)	130 (6,1%)	2121
2011	1858 (85,2%)	176 (8,1%)	148 (6,8%)	2182
2010	1748 (87,4%)	132 (6,6%)	119 (6,0%)	1999
2004-09	8948 (88,3%)	665 (6,6%)	516 (5,1%)	10129
Total	17733 (86,2%)	1647 (8,0%)	1182 (5,7%)	20562

Registration complete from 2005. 49,2% of the operations were performed on the right side. 43,6% of the operations were performed on females. 7,1% of the patients had a previous ACL/PCL-injury in the opposite knee. (13,4% was missing). Mean age was 28,7 years, 27,1 years for women and 29,8 years for men. Standard deviation of age was 10,5 years, 11,1 years for women and 9,9 years for men. Median value for duration of primary ACL reconstruction was 71 minutes.

Table 8: ACL with additional injuries

Number	ACL	PCL	MCL	LCL	PLC	Meniscus	Cartilage
6589	x						
3676	x					x	
1619	x					x	x
1283	x						x
981	x					x	
743	x					x	
434	x		x				
402	x					x	x
306	x					x	
192	x					x	x
176	x					x	x
159	x		x			x	
132	x		x				x
111	x		x			x	x
76	x		x			x	
64	x			x			
59	x	x	x				
41	x		x			x	
38	x			x	x		
35	x	x	x				x
33	x		x			x	x
26	x		x			x	
24	x		x			x	x
23	x	x					
20	x		x			x	x
20	x			x			x

x indicates registered injury and each row tell the number of incidences of different combination of injuries. The first row gives the number of records where ACL where the only injury. The table shows only combinations that have a number of 20 or more.

Table 9: PCL with additional injuries

Number	ACL	PCL	MCL	LCL	PLC	Meniscus	Cartilage
77		x					
59	x	x	x				
35	x	x	x				x
30		x					x
24	x	x	x			x

It became possible to register "Trepanation" and "None" from 01.01.2005. There have been forms where this has been an additional information. This information have been registered, but the registration is not complete before 2005.

In table 7: Actual injury has less. The reason for this is that we distinguish between the lateral and medial injury and some injuries are registered in both groups.

The value in OLD Resection are the forms that are registered before the new forms were introduced in autumn 2011. Total and Partial Resection values are the new forms were introduced in autumn 2011.

Cartilage lesion all localizations

Table 23: ICRS Grade

Definition of ICRS Grade:

1. Nearly normal: Superficial lesions, soft indentation and/or superficial fissures and cracks.
2. Abnormal: Lesions extending down to <50% of cartilage depth.
3. Severely abnormal: Cartilage defects extending down >50% of cartilage depth as well as down to calcified layer.
4. Severely abnormal: Osteochondral injuries, lesions extending just through the subchondral boneplate or deeper defects down into trabecular bone.

	Code 1	Code 2	Code 3	Code 4	Missing
2014	30,1%	44,4%	18,5%	5,4%	1,6%
2013	25,3%	49,8%	20,1%	4,5%	0,3%
2012	26,2%	47,3%	20,8%	5,0%	0,6%
2011	30,1%	44,4%	18,5%	5,9%	1,0%

6	x		x				x
6	x					x	

x indicates registered injury and each row tell the number of incidences of different combination of injuries. The first row gives the number of records where ACL where the only injury. The total number will be identical to the total number of registered ACL injuries. The table shows only combinations that have a number of more than 5.

Table 36: PCL with additional injuries

Number	ACL	PCL	MCL	LCL	PLC	Meniscus	Cartilage
5		x					
4		x					
3	x	x	x				x
3	x	x					x
3	x	x					
3		x					x

x indicates registered injury and each row tell the number of incidences of different combination of injuries. The first row gives the number of records where PCL where the only injury. The total number will be identical to the total number of registered PCL injuries. The table shows only combinations that have a number of more than 2.

It became possible to register "Trepanation" and "None" from 01.01.2005. There have been forms where this has been an additional information. This information have been registered, but the registration is not complete before 2005.

In table 36: Actual injury has less. The reason for this is that we distinguish between the lateral and medial injury and some injuries are registered in both groups.

The value in OLD Resection are the forms that are registered before the new forms were introduced in autumn 2011. Total and Partial Resection values are the new forms were introduced in autumn 2011.

Cartilage lesion all localizations

Table 50: ICRS Grade

Definition av ICRS Grade:

1. Nearly normal: Superficial lesions, soft indentation and/or superficial fissures and cracks.
2. Abnormal: Lesions extending down to <50% of cartilage depth.
3. Severely abnormal: Cartilage defects extending down >50% of cartilage depth as well as down to calcified layer.
4. Severely abnormal: Osteochondral injuries, lesions extending just through the subchondral boneplate or deeper defects down into trabecular bone.

Completeness analysis for the Cruciate Ligament Register, 2008-2012

A completeness analysis for the Cruciate Ligament Register has been conducted by combining the data in the Register with data from the Norwegian Patient Register (NPR). The report and analysis were prepared by the NPR in collaboration with the Cruciate Ligament Register. Both primary and revision ACL surgery are reported to the Cruciate Ligament Register, but in the NPR it is not possible to separate the types of operation using NCSP codes. The completeness rate in this year's report therefore only applies to cruciate ligament surgery in general. A supplementary report on the analytical procedure and results contains a more detailed analysis of primary and revision surgeries, and will be published on www.helsedirektoratet.no.

NCSP codes for combining data from NPR hospital stays and the Cruciate Ligament Register

Code	Description
NGE 11	Transcision or excision of ligament of knee; anterior cruciate, open
NGE 12	Transcision or excision of ligament of knee; posterior cruciate, open
NGE 15	Transcision or excision of ligament of knee; anterior cruciate, arthroscopic
NGE 16	Transcision or excision of ligament of knee; posterior cruciate, arthroscopic
NGE 21	Fixation of fragment of surface of knee; anterior cruciate, open
NGE 22	Fixation of fragment of surface of knee; posterior cruciate, open
NGE 25	Fixation of fragment of surface of knee; anterior cruciate, arthroscopic
NGE 26	Fixation of fragment of surface of knee; posterior cruciate, arthroscopic
NGE 31	Transposition of ligament of knee; anterior cruciate, open
NGE 32	Transposition of ligament of knee; posterior cruciate, open
NGE 35	Transposition of ligament of knee; anterior cruciate, arthroscopic
NGE 36	Transposition of ligament of knee; posterior cruciate, arthroscopic
NGE 41	Plastic repair of ligament of knee not using prosthetic material; anterior cruciate, open
NGE 42	Plastic repair of ligament of knee not using prosthetic material; posterior cruciate, open
NGE 45	Plastic repair of ligament of knee not using prosthetic material; anterior cruciate, arthroscopic
NGE 46	Plastic repair of ligament of knee not using prosthetic material; posterior cruciate, arthroscopic
NGE 51	Plastic repair of ligament of knee using prosthetic material; anterior cruciate, open
NGE 52	Plastic repair of ligament of knee using prosthetic material; posterior cruciate, open
NGE 55	Plastic repair of ligament of knee using prosthetic material; anterior cruciate, arthroscopic
NGE 56	Plastic repair of ligament of knee using prosthetic material; posterior cruciate, arthroscopic
NGE 91	Other operation on capsule or ligament of knee; anterior cruciate, open
NGE 92	Other operation on capsule or ligament of knee; posterior cruciate, open
NGE 95	Other operation on capsule or ligament of knee; anterior cruciate, arthroscopic
NGE 96	Other operation on capsule or ligament of knee; posterior cruciate, arthroscopic
NGT 19	Forcible manipulation of knee joint
NGU 69	Removal of prosthetic ligament from knee or lower leg

The completeness rate for the Cruciate Ligament Register was calculated as follows:

$$\frac{\text{(Only Cruc. Lig. Reg. + Inclusion in both registers)}}{\text{(Only NPR + Only Cruc. Lig. Reg. + Inclusion in both registers)}}$$

Completeness for the NPR was calculated in a similar way:

$$\frac{\text{(Only NPR + Inclusion in both registers)}}{\text{(Only Cruc. Lig. Reg. + Only NPR + Inclusion in both registers)}}$$

From 2008 to 2012, 12 431 cruciate ligament operations were reported to one or both of the registers. 78.1% of these were reported to the Cruciate Ligament Register, while 83.5% were reported to the NPR. The completeness by hospital is presented in Tables 76 to 80, divided into health regions, and shows considerable variation between hospitals. The Cruciate Ligament Register is based on consent, and a low completeness rate may be connected to patients refusing consent. But also erroneous use of the NCSP codes for other conditions than cruciate ligament surgery affects the completeness for the Cruciate Ligament Register. NGT19 "Forcible manipulation of knee joint" is also used for other conditions than cruciate ligament surgery, resulting in lower coverage, and it is impossible for us to check the numbers involved. Conversely, the Cruciate Ligament Register will get higher completeness if hospitals do not report to the NPR, and this probably applies to private hospitals to some extent. In order to get good data, it is important that everyone submits the registration forms to the Cruciate Ligament Register and chooses carefully the correct procedure code for the NPR.

CRUSIATE LIGAMENT SURVIVAL RATES IN NORWEGIAN HOSPITALS

For the first time, we present eight-year survival rates for primary ACL reconstructions (with additional injuries) performed at hospitals in Norway. We have included operations from 2004-2014 from hospitals with more than 50 operations during this period. The Kaplan-Meier method with a 95% confidence interval was used. We provide the unadjusted rate for all primary ACL reconstructions. The endpoint is the first revision reconstruction. Only hospitals that performed reconstructions in 2014 are included.

The results must be interpreted with caution, because differences in reoperation rates may be due to a number of factors:

1. Hospitals that are more rigorous in reporting their complications and reoperations to the Register could have unfairly negative results in the analysis.
2. If surgeons at one hospital are more diligent in facilitating check-ups for patients than at other hospitals, and thus discover more complications, this could lead to unfortunate results despite the fact that this hospital in reality is doing a better job than other hospitals.
3. If the waiting time for reoperations is longer in some hospitals than others, the longer wait could erroneously lead to better results than those of hospitals with a short waiting time.
4. If the surgeons at one hospital have a higher threshold for recommending reoperation than at other hospitals and thus prolong patients' problems, this will also give skewed results in the statistics.
5. Poor hospital results from an earlier period will remain with the hospital, even though the hospital may have acted upon previous problems by switching to better prostheses and improving procedures and surgical skills.

The completeness analysis shows the proportion of primary reconstructions each hospital has reported to NPR. Because there are not any specific codes for revision reconstruction of cruciate ligaments in NPR it is not possible to perform the completeness analysis for revision reconstructions in the Cruciate Ligament register.

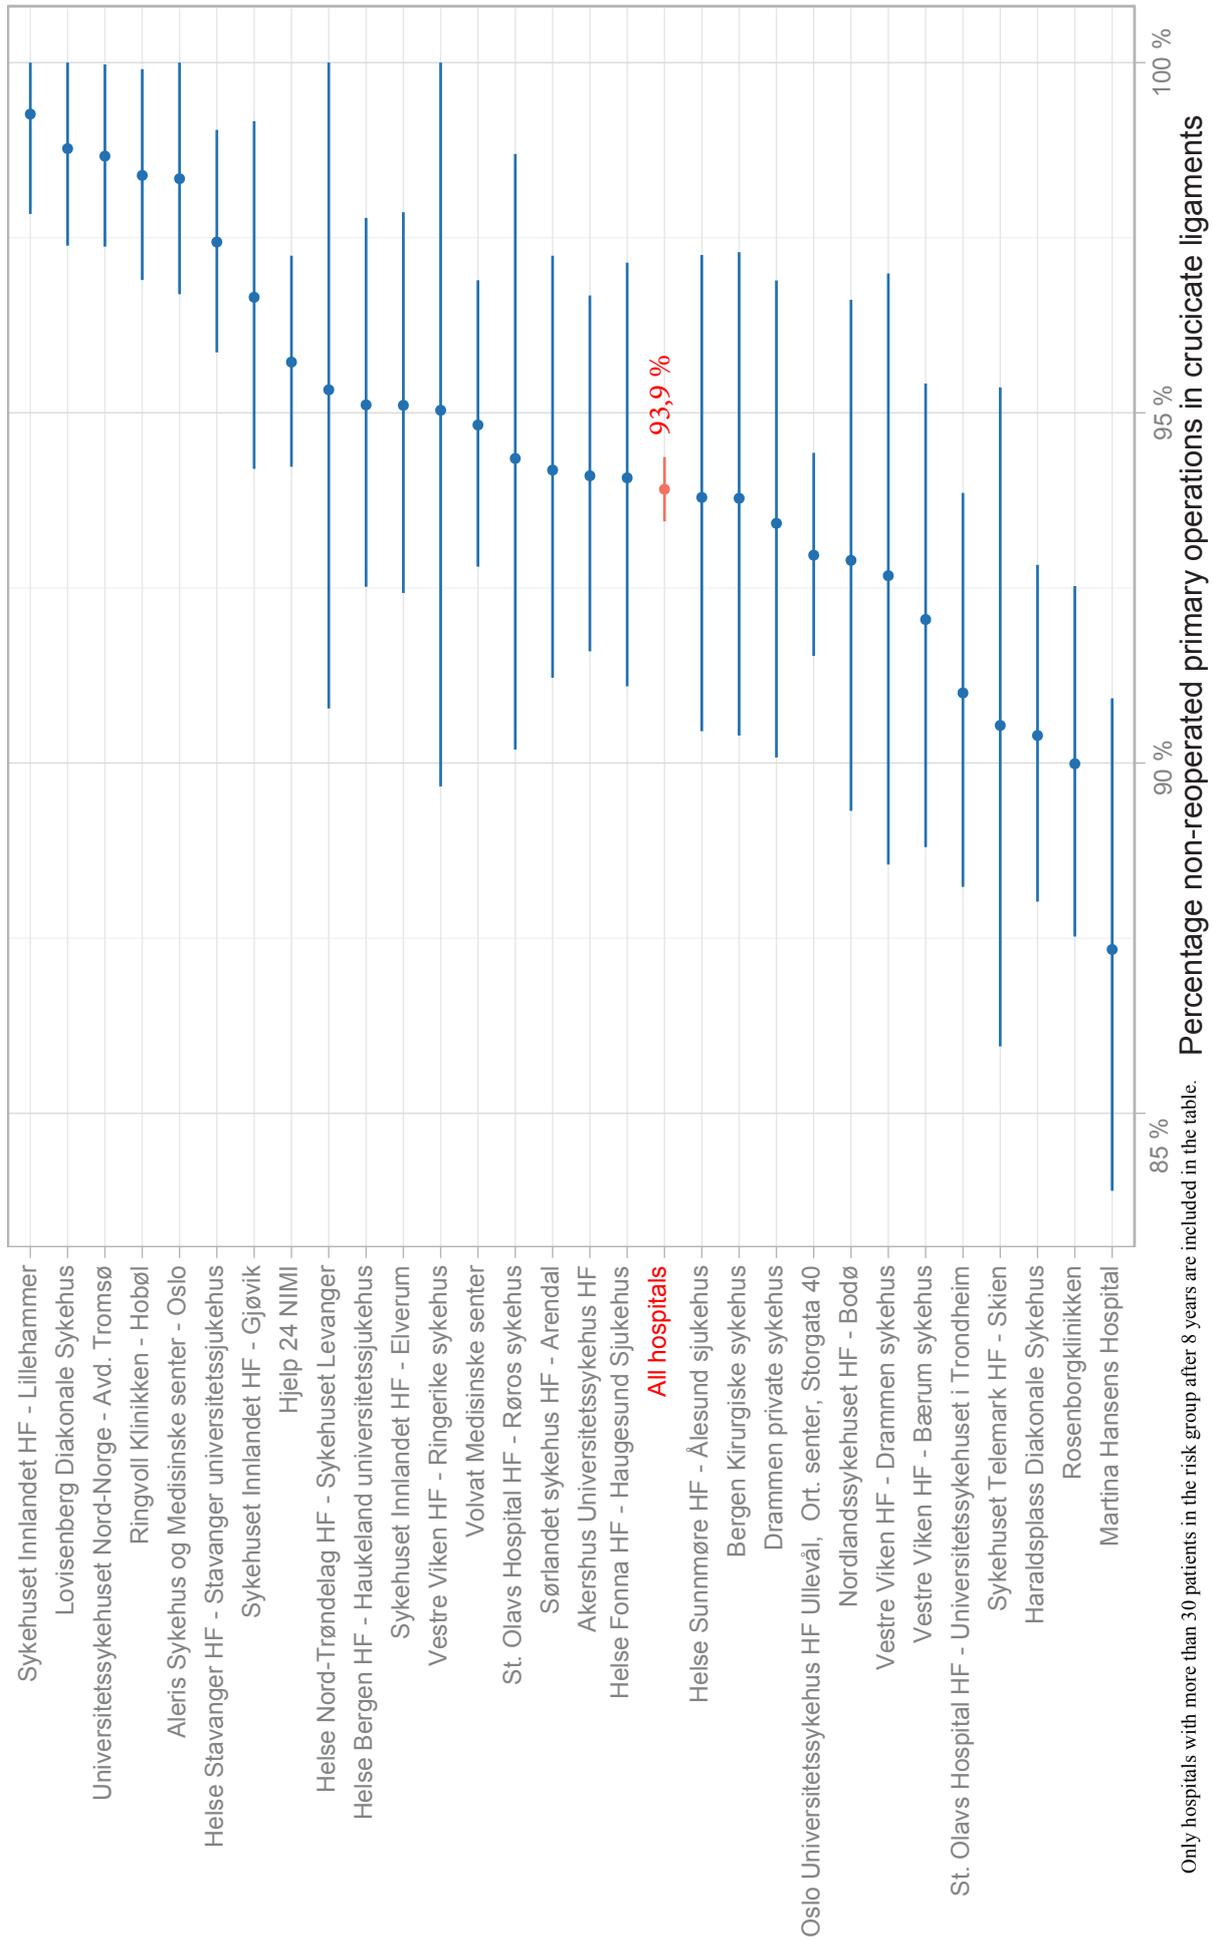

Ranking of hospitals

There is statistical uncertainty in the ranking lists because the data from the Cruciate Ligament register are poorly suited for such calculations. The register was designed to compare the results of implants and surgical procedures nationwide. To compare quality in hospitals is a complex matter, because some hospitals operate on more patients with poor prognosis than other hospitals, and because many hospitals, especially the small ones, have so few reoperations that the statistics are too weak, and are further weakened by the fact that the hospitals' completeness (reporting rate) of reoperations varies from 16.7% to 100%. This

issue is explained in detail in the following articles: Ranstam J, Wagner P, Robertsson O, Lidgren L. Health-care quality registers: outcome-orientated ranking of hospitals is unreliable. *J Bone Joint Surg Br.* 2008 and Ranstam J, Wagner P, Robertsson O, Lidgren L. [Ranking in health care results in wrong conclusions]. *Läkartidningen.* 2008 Aug 27-Sep 2;105(35):2313-4.

Moreover, it is a well-known phenomenon in quality assurance that if those who report their complications and errors receive bad publicity, the reporting deteriorates. If league tables of hospitals are publicised, there is thus a danger that hospitals' reporting of reoperations may become less reliable, leading to inferior quality of the registers.

In order to achieve complete reporting of reoperations (revisions), reporting to the Register should be linked to performance-based financing, reporting should be made mandatory, and the requirement for the patient's written consent to reporting of the operation to the Register should be waived and replaced by presumed consent.

**THE NORWEGIAN PAEDIATRIC
HIP REGISTER
2015 ANNUAL REPORT**

The Paediatric Hip Register is now in its fifth year of operation. Our experience so far has been good, although in the first year of the Register we had to work to increase compliance. This was expected and must continue to be addressed. The registration form has been revised following feedback from users, and we hope that it is now set out in a more logical and user-friendly manner.

There is rightly a major focus on Patient-Recorded Outcome Measures (PROM) as the endpoint for treatment in orthopaedic surgery. For open and arthroscopic hip replacements in young adults, we plan to use IHOT 12, a questionnaire with 12 questions, which is a simplified version of IHOT 33. IHOT 12 has now been translated, ready for use. In the past year, we have been cooperating with Swedish paediatric orthopaedists who are in the process of establishing their own paediatric orthopaedic register. We aim to use as similar parameters as possible in the two national registers, and we are close to agreement on a common PROM system to be used in both registers. During the past year, open and arthroscopic hip replacements have also been registered, but there is a need for further revision of this part of the form, with help from arthroscopy surgeons.

The collecting of radiographs of children in the Register has functioned satisfactorily, and we now have over 4000 images in our database. We have developed a computer programme that combines the data from the Register with the radiographs and this will be a useful tool in the analysis of data and images.

A PhD candidate, Anne Kristin Reve, is now attached to the Register. She is an assistant physician in the Orthopaedic Department of Stavanger University Hospital. She is currently working on the compliance study, which will soon be completed. She plans to start epidemiological studies of paediatric hip diseases in Norway. At the autumn meeting of the Norwegian Orthopaedic Association in 2014, she presented the status of the Paediatric Hip Register after three years of operation.

In 2014, we applied to the National Service Centre for Medical Quality Registers for status as a national quality register. In all probability, our Register will be approved, which will ensure future funding.

HOFTEPROTESER

ALLE TOTALPROTESER I HOFTELEDD REGISTRERES. Innsetting, skifting og fjerning av totalproteser i hofteledd, samt kantplastikk, bløtdelsrevisjon for infisert protese og hemiprotoser på annen indikasjon enn fraktur/fraktursekvele. Hemiprotese for fraktur/fraktursekvele registreres på Hoftebruddskjema.

TIDLIGERE OPERASJON I AKTUELLE HOFTE (ev. flere kryss)

- ⁰ Nei
- ¹ Osteosyntese for fraktur i prox. femurende
- ² Hemiprotese pga. fraktur
- ³ Osteotomi
- ⁴ Artrodese
- ⁵ Totalprotese(r)
- ⁶ Annen operasjon

OPERASJONSDATO (dd.mm.åå)

AKTUELLE OPERASJON (ett kryss)

- ¹ Primæroperasjon (også hvis hemiprotese tidligere)
- ² Reoperasjon (totalprotese tidligere)
- ³ Primær hemiprotese for annen indikasjon enn fraktur/fraktursekvele

AKTUELLE SIDE (ett kryss) (Bilateral opr. = 2 skjema)

- ¹ Høyre ² Venstre

ÅRSAK TIL AKTUELLE OPERASJON (KRYSS AV ENTEN I A ELLER B)

A Primæroperasjon pga. (evt. flere kryss)

- ¹ Idiopatisk coxartrose
 - ² Rheumatoid artritt
 - ³ Sekvele etter frakt. colli. fem.
 - ⁴ Sekv. dysplasi
 - ⁵ Sekv. dysplasi med total luksasjon
 - ⁶ Sekv. Perthes
 - ⁷ Sekv. Epifysiolyse
 - ⁸ Mb. Bechterew
 - ⁹ Akutt fraktura colli femoris
 - Annet
- (f.eks caputnekrose, tidl. artrodese o.l.)

B Årsak til reoperasjon (evt. flere kryss)

- ¹ Løs acetabularkomponent
 - ² Løs femurkomponent
 - ³ Luksasjon
 - ⁴ Dyp infeksjon
 - ⁵ Fraktur (i acetabulum)
 - ⁶ Fraktur (av femur)
 - ⁷ Smerter
 - ⁸ Osteolyse i acetab. uten løsning
 - ⁹ Osteolyse i femur uten løsning
 - Annet
- (f.eks Girdlestonesituasjon etter tidl. infisert protese)
- ¹⁰ Implantatfraktur femurdell
 - ¹¹ Implantatfraktur caput
 - ¹² Implantatfraktur kopp
 - ¹³ Implantatfraktur liner
 - ¹⁴ Implantatfraktur annet:

REOPERASJONSTYPE (ev. flere kryss)

- ¹ Bytte av femurkomponent
- ² Bytte av acetabularkomponent
- ³ Bytte av hele protesen
- ⁴ Fjernet protese og satt inn sementspacer
- ⁵ Fjernet sementspacer og satt inn ny protese
- ⁶ Fjernet protese (Girdlestone eller fjerning av sementspacer)
Angi hvilke deler som ble fjernet
- ⁷ Bytte av plastforing
- ⁸ Bytte av caput
- ⁹ Bløtdelsdebridement for infisert protese
- Andre operasjoner

TILGANG (ett kryss)

Lege

Legen som har fylt ut skjemaet (navnet registreres ikke i databasen).

RETTLEDNING TIL HOFTEPROTESER

Registreringen gjelder innsetting, skifting og fjerning av totalproteser i hofteledd, samt kantplastikk, bløtdelsrevisjon for infisert protese og hemiprotoser på annen indikasjon enn fraktur/fraktursekvele. Hemiprotese for fraktur/ fraktursekvele registreres på Hoftebruddskjema. Ett skjema fylles ut for hver operasjon. Fødselsnummer (11sifre) og sykehusnavn må påføres. Aktuelle ruter markeres med kryss. På eget Samtykkeskjema skal pasienten gi samtykke til rapportering til Leddregisteret. Samtykkeskjema skal lagres i pasientjournal.

AKTUELLE OPERASJON

Primæroperasjoner: Dette er første totalproteseoperasjon.

Reoperasjon (totalprotese tidligere): Fjerning av protesedeler (f.eks. Girdlestone) må registreres. Kantplastikk (f. eks. PLAD) og bløtdelsrevisjoner for infeksjon registreres selv om protesedeler ikke skiftes.

Primær hemiprotese for annen indikasjon enn fraktur/fraktursekvele: Hemiprotese for fraktur/fraktursekvele registreres på Hoftebruddskjema.

ÅRSÅK TIL AKTUELLE OPERASJON

Kryss av under A ved primæroperasjoner og under B ved reoperasjoner. I B må du krysse av for alle årsakene til reoperasjon, eller forklare med fritekst.

REOPERASJONSTYPE

Fjerning av protesedeler (f.eks. Girdlestone) må registreres. Kantplastikk (f. eks. PLAD) og bløtdelsrevisjoner for infeksjon registreres selv om protesedeler ikke skiftes.

TILGANG

Det vises til artikkel: Reigstad A, Blom Hagen T. Snittføring ved totalplastikk i hofteleddet. Tidsskr Nor Lægeforen. 1985 Mar 30;105(9-10):677-9.

BENTRANSPLANTASJON Benpropp som sementstopper regnes ikke som bentransplantat.

PROTESEKOMPONENTER: Acetabulum - Femur - Caput - Trokanterdel og hals hvis disse er separate deler

Bruk helst klistrelappene som følger med protesen. Lim disse på baksiden av skjema. Alternativt, skriv inn protesenavn + katalognummer eller protesenavn + størrelse, materiale, overflatebelegg og design. Sementnavn må anføres.

KOMPLIKASJONER Også operasjoner hvor pasienter dør på operasjonsbordet eller rett etter operasjon skal meldes. Ved stor stor blødning, angi mengde.

ASA-KLASSE (ASA=American Society of Anesthesiologists)

ASA-klasse 1: Friske pasienter som røyker mindre enn 5 sigaretter daglig.

ASA-klasse 2: Pasienter med en asymptomatisk tilstand som behandles medikamentelt (f.eks hypertensjon)

eller med kost (f.eks diabetes mellitus type 2) og ellers friske pasienter som røyker 5 sigaretter eller mer daglig.

ASA-klasse 3: Pasienter med en tilstand som kan gi symptomer, men som holdes under kontroll medikamentelt

(f.eks moderat angina pectoris og mild astma).

ASA-klasse 4: Pasienter med en tilstand som ikke er under kontroll (f.eks hjertesvikt og astma).

ASA-klasse 5: Moribund/døende pasient

MINIINVASIV KIRURGI (MIS = Minimally Invasive Surgery)

Med MIS menes her at kirurgen har brukt kort snitt og at det er brukt spesialinstrument laget for MIS

SYSTEMISK ANTIBIOTIKA

Her føres det på hvilket antibiotikum som er blitt benyttet i forbindelse med operasjonen, f.eks.: Medkament 1: Keflin 2g x 4, med varighet 12 timer.

TROMBOSEPROFYLAKSE

Medikament, dose og antatt varighet av profylaksen skal angis separat for operasjonsdagen og senere. Det skal også oppgis om pasienten står fast på antikoagulantia (AlbylE, Marevan, Plavix ol).

FIBRINOLYSEHEMMER

Her føres det på om en benytter blødningsreducerende legemidler i forbindelse med operasjonen (f.eks. Cyklokapron).

BEINTAP VED REVISJON

Femur (Paprosky's klassifikasjon)

Type I: Minimalt tap av metafysært ben og intakt diafyse.

Type II: Stort tap av metafysært ben, men intakt diafyse.

Type IIIA: Betydelig tap av metafysært ben uten mulighet for proximal mekanisk støtte. Over 4 cm intakt corticalis i isthmusområdet.

Type IIIB: Betydelig tap av metafysært ben uten mulighet for proximal mekanisk støtte. Under 4 cm intakt corticalis i isthmusområdet.

Type IV: Betydelig tap av metafysært ben uten mulighet for proximal mekanisk støtte. Bred isthmus med liten mulighet for cortical støtte.

Acetabulum (Paprosky's klassifikasjon)

Type I: Hemisfærisk acetabulum uten kantdefekter. Intakt bakre og fremre kolonne. Defekter i forankringshull som ikke ødelegger subchondral benplate.

Type IIA: Hemisfærisk acetabulum uten store kantdefekter, intakt bakre og fremre kolonne, men med lite metafysært ben igjen.

Type IIB: Hemisfærisk acetabulum uten store kantdefekter, intakt bakre og fremre kolonne, men med lite metafysært ben igjen og noe manglende støtte superior.

Type IIC: Hemisfærisk acetabulum uten store kantdefekter, intakt bakre og fremre kolonne, men med defekt i medial vegg.

Type IIIA: Betydelig komponentvandring, osteolyse og bentap. Bentap fra kl. 10 til 2.

Type IIIB: Betydelig komponentvandring, osteolyse og bentap. Bentap fra kl. 9 til 5.

 Legen som har fylt ut skjemaet (navnet registreres ikke i databasen).

RETTLEDNING KNEPROTESER og andre leddproteser

Registreringen gjelder innsetting, skifting eller fjerning av protese i kne, skuldre og andre ledd med unntak av hofter som har eget skjema. Ett skjema fylles ut for hver operasjon. Pasientens fødselsnummer (11 sifre) og sykehus må være påført. Aktuelle ruter markeres med kryss.

Pasienten skal på eget skjema gi samtykke til registrering, samtykkeskjemaet skal lagres i pasientjournalen.

Kommentarer til de enkelte punktene

AKTUELLE OPERASJON

Primæroperasjon: Dette er første totalproteseoperasjon.

Kryss av enten i A eller i B. Kryss av for alle årsakene til operasjonen. Bløtdelsrevisjon for infeksjon skal registreres selv om protesedeler ikke skiftes.

REOPERASJONSTYPE

Fjerning av protesedeler må spesifiseres og føres opp, også fjerning ved infeksjon.

BENTRANSPANTASJON

Påsmøring av benvev rundt protesen regnes ikke som bentransplantat.

SYSTEMISK ANTIBIOTIKA

Medikament, dose og varighet av profylaksen skal angis f.eks. slik: Medikament: Keflin, Dosering: 2g x 4, Varighet: 12 timer, altså 4 doser i løpet av 12 timer.

TROMBOSEPROFYLAKSE

Medikament, dose og antatt varighet av profylaksen skal angis separat for operasjonsdagen og senere. Det skal også oppgis om pasienten står fast på antikoagulantia (AlbylE, Marevan, Plavix ol).

FIBRINOLYSEHEMMER

Her føres det på om en benytter blødningsreducerende legemidler i forbindelse med operasjonen (f.eks. Cyklokapron).

PEROPERATIV KOMPLIKASJON

Dersom det foreligger komplikasjon i form av stor blødning, må mengden angis.

Dersom pasienten dør under eller like etter operasjonen, ønsker vi likevel melding om operasjonen.

ASA-KLASSE (ASA=American Society of Anesthesiologists)

ASA-klasse 1: Friske pasienter som røyker mindre enn 5 sigaretter daglig.

ASA-klasse 2: Pasienter med en asymptomatisk tilstand som behandles medikamentelt (f.eks hypertensjon) eller med kost (f.eks diabetes mellitus type 2) og ellers friske pasienter som røyker 5 sigaretter eller mer daglig.

ASA-klasse 3: Pasienter med en tilstand som kan gi symptomer, men som holdes under kontroll medikamentelt (f.eks moderat angina pectoris og mild astma).

ASA-klasse 4: Pasienter med en tilstand som ikke er under kontroll (f.eks hjertesvikt og astma).

ASA-klasse 5: Moribund/døende pasient

PROTESETYPE

Dersom det er gjort revisjon av totalprotese uten patellakomponent og REOPERASJONSTYPE er **innsetting av patellakomponent**, skal det krysses av for pkt. 1: Totalprotese med patellakomponent (dvs. protesen har nå blitt en totalprotese med patellakomponent). Ved revisjon av unicondylær protese til totalprotese brukes enten pkt. 1 eller 2.

PROTESEKOMPONENTER

Her anføres kommersielle navn, materiale, størrelse og design. Alternativt kan en føre opp protesenavn og katalognummer eller benytte klistrelapp som følger med de fleste protesene. **Denne kan limes på baksiden av skjemaet (vennligst ikke plasser klistrelapper på markeringskryss, som brukes ved scanning av skjema).**

Navnet på sementen som evt. brukes må anføres, f.eks. Palacos R+G. (Bruk helst klistrelapp)

Under femurkomponent skal evt. påsatt **femurstamme** anføres med lengde.

Med **metallforing** under femur og tibia komponent menes bruk av en eller flere separate metallkiler (wedges) som erstatning for manglende benstøtte. Stabilisering er bruk av proteser med stabilisering som kompensasjon for sviktende båndapparat.

Forlenget sentral stamme under tibiakomponent (metallplata) skal bare anføres ved bruk av en lengre påsatt stamme enn standardkomponenten.

ANDRE LEDD. PROTESETYPE

Ved bruk av hemiprotese med bare en komponent, f.eks. resurfacing i skulder, skrives dette på DISTAL KOMPONENT. Enkomponent-protese i finger/tå, skrives på PROKSIMAL KOMPONENT.

COMPUTERNAVIGERING (CAOS = Computer Aided Orthopaedic Surgery)

Angi firmanavn på computersystem.

MINIINVASIV KIRURGI (MIS = Minimally Invasive Surgery)

Her menes at kirurgen har brukt kort snitt og at det er brukt spesialinstrument laget for MIS.

PASIENTTILPASSEDE INSTRUMENTER

Her menes kutteblokker eller instrumenter som lages etter MR eller CT bilder tatt av pasienten før operasjonen. Oppgi navn på systemet.

Kopi beholdes til pasientjournalen, originalen sendes Haukeland universitetssjukehus.

Lege.....
Legen som har fylt ut skjemaet (navnet registreres ikke i databasen).

RETTLEDNING

Registreringen gjelder alle operasjoner for hoftebrudd (lårhals, pertrokantære og subtrokantære) og alle reoperasjoner, også reoperasjoner, på pasienter som er primæroperert og reoperert for hoftebrudd. **Ved primæroperasjon med totalprotese og ved reoperasjon til totalprotese sendes bare skjema til hofteproteseregisteret.**

Ett skjema fylles ut for hver operasjon. Originalen sendes Haukeland universitetssjukehus og kopien lagres i pasientens journal. Pasientens fødselsnummer (11 sifre) og sykehuset må være påført. Aktuelle ruter markeres med kryss. Pasienten skal på eget skjema gi samtykke til registrering i Nasjonalt hoftebruddregister og samtykkeerklæringen lagres i pasientens journal på sykehuset.

Kommentarer til enkelte punkt:

OPERASJONS- OG BRUDDTIDSPUNKT

Operasjonstidspunkt (dato og klokkeslett) må føres opp på alle primæroperasjoner. Det er også sterkt ønskelig at dato og klokkeslett for *bruddtidspunkt* føres opp. Dette bl.a. for å se om tid til operasjon har effekt på prognose. (Hvis en ikke kjenner klokkeslettet for bruddtidspunkt lar en feltet stå åpent. En må da prøve å angi omtrentlig tidsrom fra brudd til operasjon på neste punkt).

Ved reoperasjon er ikke klokkeslett nødvendig.

DEMENS

Demens kan eventuelt testes ved å be pasienten tegne klokken når den er 10 over 11. En dement pasient vil ha problemer med denne oppgaven.

ASA-KLASSE (ASA=American Society of Anesthesiologists)

ASA-klasse 1: Friske pasienter som røyker mindre enn 5 sigaretter daglig.

ASA-klasse 2: Pasienter med en asymptomatisk tilstand som behandles medikamentelt (f.eks hypertensjon) eller med kost (f.eks diabetes mellitus type 2) og ellers friske pasienter som røyker 5 sigaretter eller mer daglig.

ASA-klasse 3: Pasienter med en tilstand som kan gi symptomer, men som holdes under kontroll medikamentelt (f.eks moderat angina pectoris og mild astma).

ASA-klasse 4: Pasienter med en tilstand som ikke er under kontroll (f.eks hjertesvikt og astma).

ASA-klasse 5: Moribund/døende pasient

GARDENS KLASSIFISERING AV LÅRHALSBRUDD

Garden 1: Ikke komplett brudd av lårhalsen (såkalt innkilt)

Garden 2: Komplet lårhalsbrudd uten dislokasjon

Garden 3: Komplet lårhalsbrudd med delvis dislokasjon. Fragmentene er fortsatt i kontakt, men det er feilstilling av lårhalsens trabekler. Caputfragmentet ligger uanatomisk i acetabulum.

Garden 4: Komplet lårhalsbrudd med full dislokasjon. Caputfragmentet er fritt og ligger korrekt i acetabulum slik at trabeklene er normalt orientert.

AO KLASSEKASJON AV TROKANTÆRE BRUDD

A1: Pertrokantært tofragment brudd

A2: Pertrokantært flerfragment brudd

A3: Intertrokantært brudd

Subtrokantært brudd*

*Subtrokantært brudd: Bruddsentrum er mellom nedre kant av trokanter minor og 5 cm distalt for denne.

REOPERASJONSÅRSÅK

Dyp infeksjon defineres som infeksjon som involverer fascie, protese, ledd eller periprotetisk vev.

IMPLANTAT

Implantattype må angis entydig. Produktklistrelapp er ønskelig for å angi katalognummer for osteosyntesematerialet eller protesen som er brukt.

PEROPERATIVE KOMPLIKASJONER

Vi ønsker også å få meldt dødsfall på operasjonsbordet og peroperativ transfusjonstrengende blødning.

SYSTEMISK ANTIBIOTIKA

Her føres det på hvilket antibiotikum som er blitt benyttet i forbindelse med operasjonen. Det anføres dose, antall doser og profylaksens varighet. F.eks. Medkament 1: Keflin 2g x 4, med varighet 12 timer.

TROMBOSEPROFYLAKSE

Medikament, dose og antatt varighet av profylaksen skal angis separat for operasjonsdagen og senere. Det skal også oppgis om pasienten står fast på antikoagulantia (AlbylE, Marevan, Plavix ol).

FIBRINOLYSEHEMMER

Her føres det på om en benytter blødningsreducerende legemidler i forbindelse med operasjonen (f.eks. Cyklokapron).

DATO: _____ **OPERASJONSDATO:** _____

FØDSELSNR (11 siffer): _____

NAVN: _____

SYKEHUS: _____

Veiledning: Dette spørreskjemaet inneholder spørsmål om hvordan du opplever kneet ditt før operasjonen. Informasjonen vil hjelpe oss til å følge med i hvordan du har det og fungerer i ditt daglige liv. Besvar spørsmålene ved å krysse av for det alternativ du synes stemmer best for deg (kun ett kryss ved hvert spørsmål). Hvis du er usikker, kryss likevel av for det alternativet som føles mest riktig.

KRYSS AV FOR RIKTIG KNE (NB: Ett skjema for hvert kne): ¹ **VENSTRE** ⁰ **HØYRE**

Røyker du? ⁰ Nei ¹ Av og til ² Daglig
Hvis du røyker daglig –
hvor mange sigaretter per dag: _____

Vekt: _____ kg

Høyde : _____ cm

Symptom

Tenk på **symptomene** du har hatt fra kneet ditt den **siste uken** når du besvarer disse spørsmålene.

S1. Har kneet vært hovent?

Aldri	Sjelden	I blant	Ofte	Alltid
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

S2. Har du følt knirking, hørt klikking eller andre lyder fra kneet?

Aldri	Sjelden	I blant	Ofte	Alltid
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

S3. Har kneet haket seg opp eller låst seg?

Aldri	Sjelden	I blant	Ofte	Alltid
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

S4. Har du kunnet rette kneet helt ut?

Alltid	Ofte	I blant	Sjelden	Aldri
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

S5. Har du kunnet bøye kneet helt?

Alltid	Ofte	I blant	Sjelden	Aldri
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

Stivhet

De neste spørsmålene handler om **leddstivhet**. Leddstivhet innebærer vanskeligheter med å komme i gang eller økt motstand når du bøyer eller strekker kneet. Marker graden av leddstivhet du har opplevd i kneet ditt den **siste uken**.

S6. Hvor stivt er kneet ditt når du nettopp har våknet om morgenen?

Ikke noe	Litt	Moderat	Betydelig	Ekstremt
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

S7. Hvor stivt er kneet ditt senere på dagen etter å ha sittet, ligget eller hvilt?

Ikke noe	Litt	Moderat	Betydelig	Ekstremt
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

Smerte

P1. Hvor ofte har du vondt i kneet?

Aldri	Månedlig	Ukentlig	Daglig	Hele tiden
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

Hvilken grad av smerte har du hatt i kneet ditt den **siste uken** ved følgende aktiviteter?

P2. Snu/vende på belastet kne

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

P3. Rette kneet helt ut

Ingen	Lett	Moderat	Betydelig	Svært stor

Funksjon i hverdagen

De neste spørsmålene handler om din fysiske funksjon. **Angi graden av vanskeligheter du har opplevd den siste uken ved følgende aktiviteter på grunn av dine kneproblemer.**

A1. Gå ned trapper

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A2. Gå opp trapper

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A3. Reise deg fra sittende stilling

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

Angi graden av **vanskeligheter** du har opplevd ved hver aktivitet den **siste uken**.

A4. Stå stille

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A5. Bøye deg, f.eks. for å plukke opp en gjenstand fra gulvet

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A6. Gå på flatt underlag

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A7. Gå inn/ut av bil

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A8. Handle/gjøre innkjøp

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A9. Ta på sokker/strømper

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A10. Stå opp fra sengen

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A11. Ta av sokker/strømper

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A12. Ligge i sengen (snu deg, holde kneet i samme stilling i lengre tid)

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A13. Gå inn/ut av badekar/dusj

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A14. Sitte

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A15. Sette deg og reise deg fra toalettet

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A16. Gjøre tungt husarbeid (måke snø, vaske gulv, støvsuge osv.)

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

A17. Gjør lett husarbeid (lage mat, tørke støv osv.)

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

Funksjon, sport og fritid

De neste spørsmålene handler om din fysiske funksjon. **Angi graden av vanskeligheter du har opplevd den siste uken ved følgende aktiviteter på grunn av dine kneproblemer.**

SP1. Sitte på huk

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

SP2. Løpe

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

SP3. Hoppe

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

SP4. Snu/vende på belastet kne

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

SP5. Stå på kne

Ingen	Lett	Moderat	Betydelig	Svært stor
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

Livskvalitet

Q1. Hvor ofte gjør ditt kneproblem seg bemerket?

Aldri	Månedlig	Ukentlig	Daglig	Alltid
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

Q2. Har du forandret levesett for å unngå å overbelaste kneet?

Ingenting	Noe	Moderat	Betydelig	Fullstendig
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

Q3. I hvor stor grad kan du stole på kneet ditt?

Fullstendig	I stor grad	Moderat	Til en viss grad	Ikke i det hele tatt
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

Q4. Generelt sett, hvor store problemer har du med kneet ditt?

Ingen	Lette	Moderate	Betydelige	Svært store
<input type="checkbox"/> ⁰	<input type="checkbox"/> ¹	<input type="checkbox"/> ²	<input type="checkbox"/> ³	<input type="checkbox"/> ⁴

Takk for at du tok deg tid og besvarte samtlige spørsmål!

RETTLEDNING

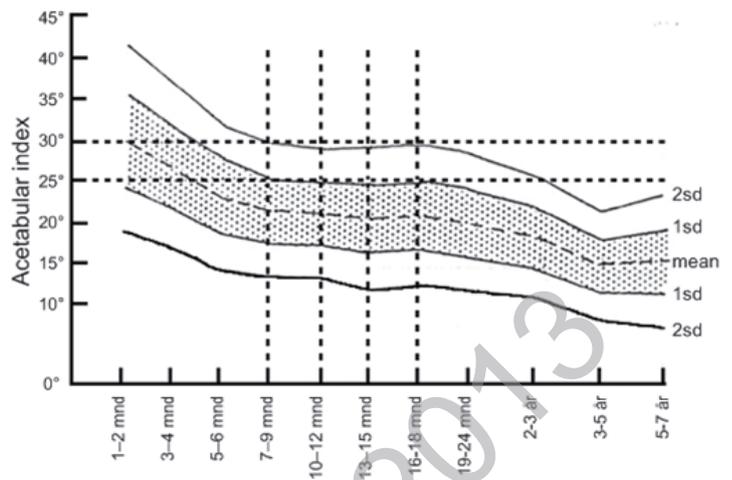

1. HOFTEDYSPLASI

Kriterier: AI > mean + 2SD for aktuell alder (Se figur)

Alle barn som på røntgen bekken får påvist hoftedysplasi etter 3 måneders alder skal registreres. Barn som er diagnostisert før 3 måneders alder (putebehandling) registreres hvis de fortsatt har dysplasi på røntgen bekken på kontroll etter 3 måneders alder. Barn med neuroortopediske lidelser skal ikke registreres.

- Registreres første gang ved diagnose (røntgen bekken)/primærbehandling
- Registreres ved senere behandling som krever anestesi/ sedasjon Lukket reposisjon/ hoftegips, åpen reposisjon, tenotomier, femur-/bekkenosteotomier, reoperasjoner. Operativ behandling (periacetabulære osteotomier, takplastikk og lignende) hos ungdommer og voksne skal også registreres.

CAPUTKJERNE: Ved unilateral – sammenlign med frisk side.

2. CALVÉ-LEGG-PERTHES

- Registreres første gang ved diagnose/primærbehandling
- Registreres ved senere behandling som krever anestesi (Femur-/bekkenosteotomier, reoperasjoner)

CATTERALL: VII = <50 % caputnekrose. III/IV = >50 % caputnekrose

3. EPIFYSIOLYSIS CAPITIS FEMORIS

- Registreres første gang ved diagnose/primærbehandling
- Registreres ved senere behandling som krever anestesi Osteosyntese, femurosteotomier, reoperasjoner.

4. ÅPNE OG ARTROSKOPISKE HOFTEOPERASJONER

Alle pasienter (uavhengig av alder) som gjennomgår åpen eller artroskopisk hofteoperasjon, unntatt fraktur-, protese- og tumor-operasjoner, skal registreres.

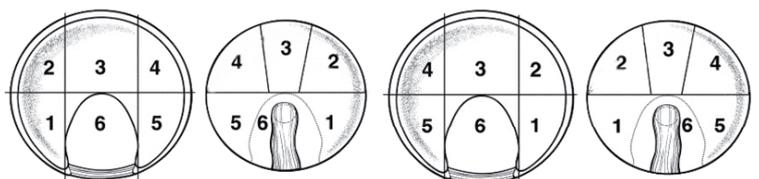

Bruskskade i acetabulum – Grade:

0=Normal.

- 1=Loss of fixation to the subchondral bone resulting in a wave sign, defined as occurring when the capsular side of the labrum is pushed inwards with the probe resulting in bulging of the adjacent articular cartilage.
- 2=Presence of cleavage tear with obvious separation at the chondrolabral junction.
- 3=Delamination of the articular cartilage.
- 4=Presence of exposed bone in the acetabulum.

Bruskskade i acetabulum og på caput femoris – Lokalisasjon:

1-2: Fortil, 4-5: Baktill

Venstre hofte

Høyre hofte

Bruskskade på caput femoris – Dybde (ICRS):

- 1=Nearly normal: Superficial lesions, soft indentation and/or superficial fissures and cracks.
- 2=Abnormal: Lesions extending down to <50% of cartilage depth.
- 3=Severely abnormal: Cartilage defects extending down to >50% of cartilage depth as well as down to calcified layer.
- 4=Severely abnormal: Osteochondral injuries, lesions extending just through the sub chondral boneplate or deeper defects down into trabecular bone.
